Alojz Gomola | 12th July 2019, Porto | Defense Presentation of Doctoral Thesis in Applied Mathematics

Obstacle avoidance based on Reach Sets

Speech:

- Dear (Lady, and Gentlemen), my name is Alojz Gomola and for today I am going to defend thesis with title:
- “Obstacle avoidance based on Reach Sets”,
- Which was **lead** by
- Joao Sousa from LSTS, and
- Fernando Lobo Pereira from FEUP,

Your Notes:

Overview

Sense & Avoid introduction:

- Context of SAA
- Actors
- Reactive Obstacle Avoidance

Problems in Detect & Avoid:

- Explained as a story
- Incremental problem definition

Related work:

- Movement Automaton
- Surveillance
- Navigation
- Reach set estimation

Proposed framework:

- Overview
- Avoidance Run
- UTM Implementation
- Rule Engine

Simulations:

- Test Plan
- Obstacle avoidance
- Weather avoidance
- Rules of the Air
- Cooperative vs. Noncooperative

Conclusion

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Let me start with short overview,

First there will be an introduction into Detect and Avoid,

Then I will outline problems which we approached,

The brief introduction of “Related work and used concepts”

Is necessary before we go through “Proposed framework”

After that the test cases and performance will be shown

Your Notes:

Sense & Avoid Introduction:

Airspace classification

UAS Traffic Management

Terminology

Reactive Avoidance

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The main goal of the thesis was to develop a framework,

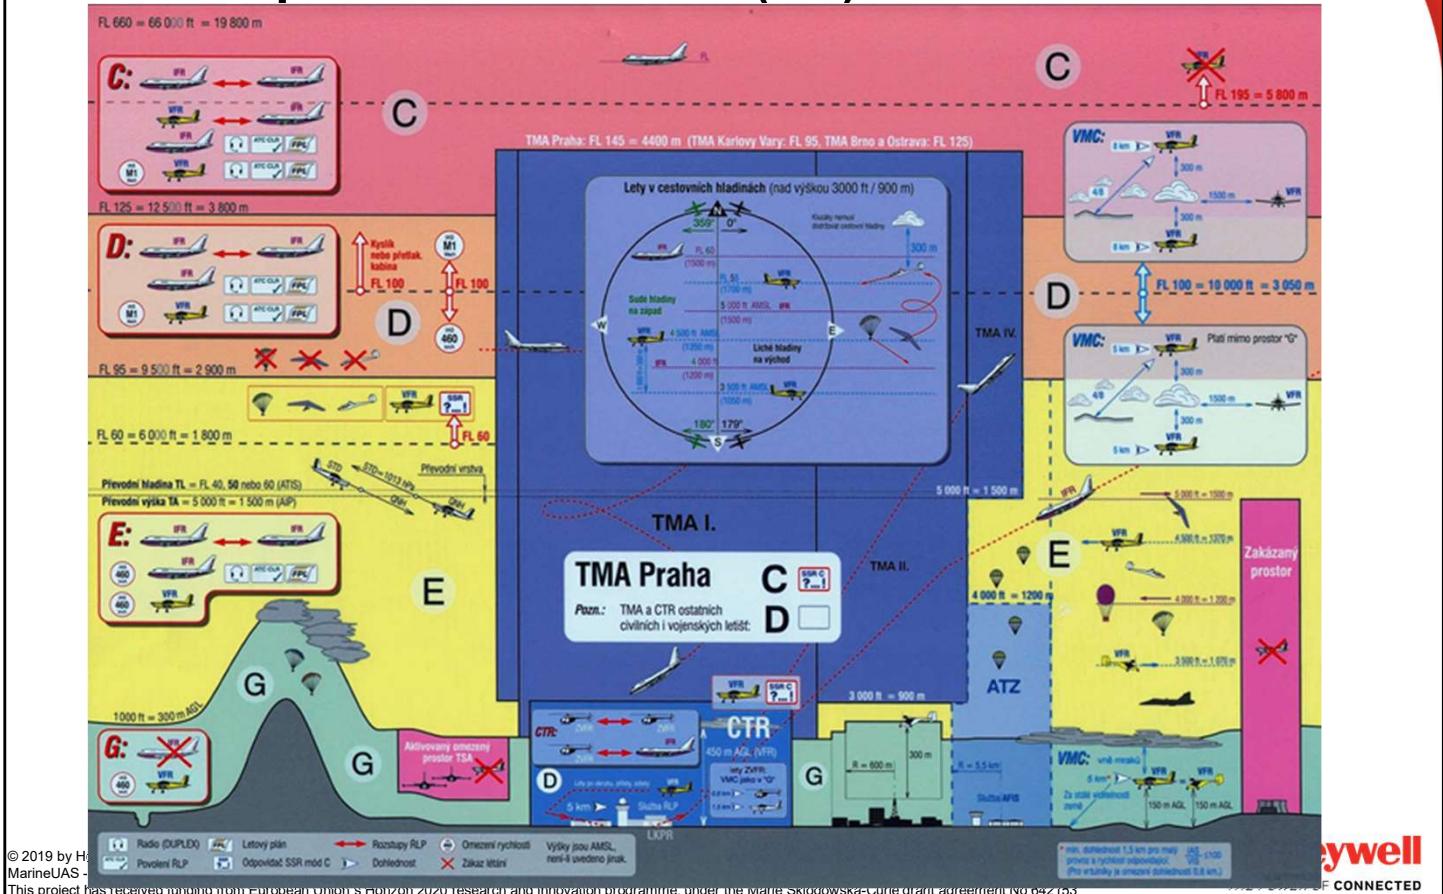

Which is capable to fly in “non-segregated airspace”,

Lets start with short introduction

Note: All Airspace related rules and constraints can be found in chapter 2. This section is only a short introduction.

Your Notes:

Context of SAA: Airspace classification (2.2)

Speech:

There is airspace vertical classification based on altitude,

Different rules and authorities applies on different

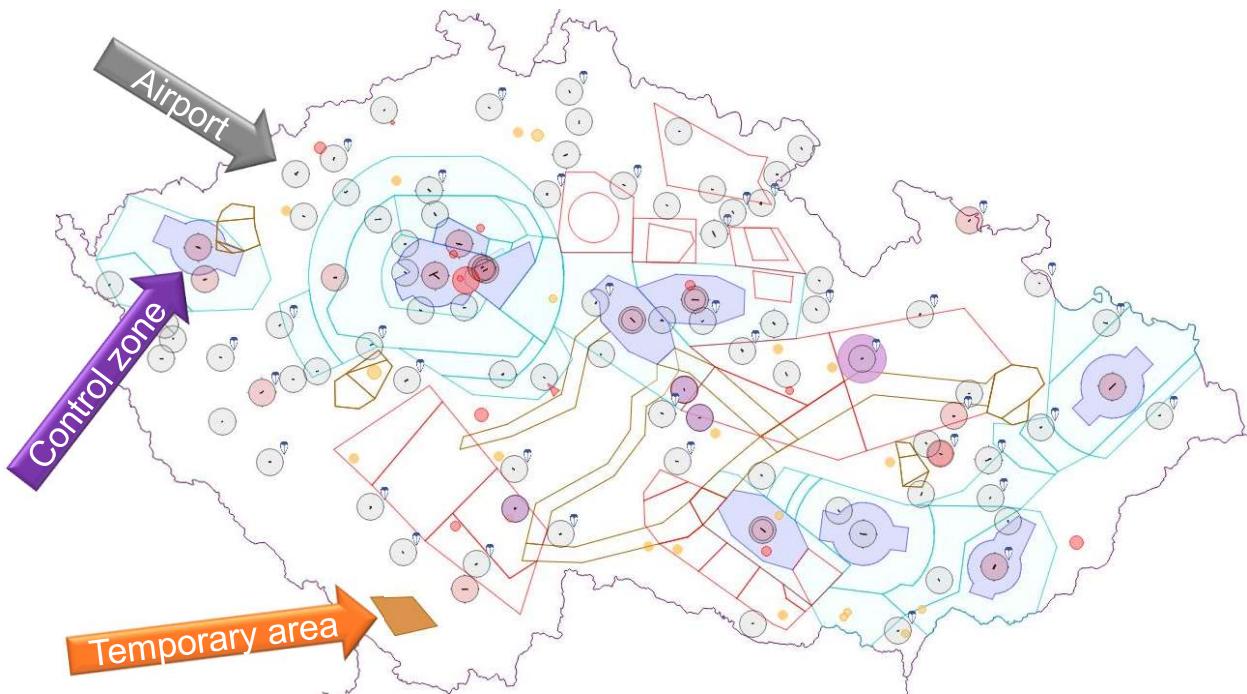

“flight levels”,

“C class airspace” is where passenger planes operates

Note: There is slight difference between countries, this example is valid for Czech/Slovak Republic.

Your Notes:

Context of SAA: Airspace restrictions (2.3)

*Example of air traffic constraints is taken from Czech national air traffic control portal (<http://aisview.rlp.cz/>)

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

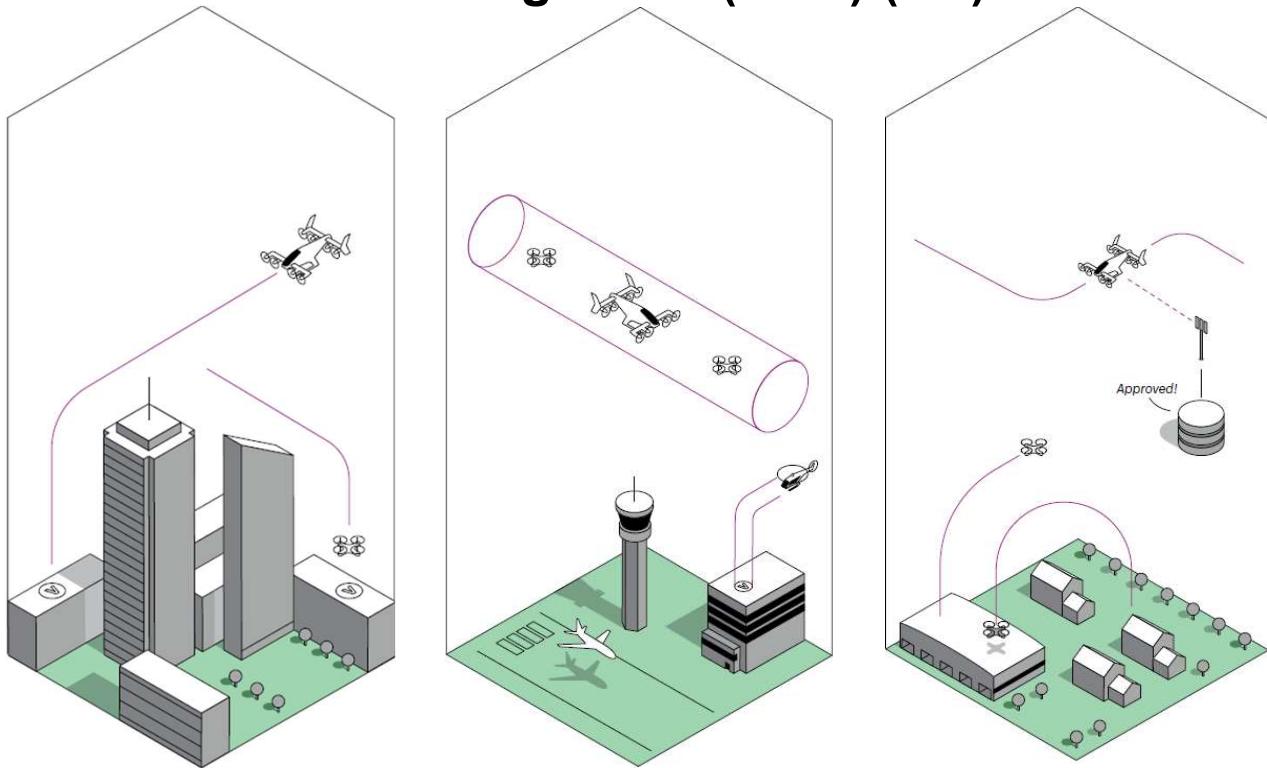

Speech:

The same goes for horizontal plane restrictions,
Airspace authority can prohibit operations in specific area,
For example the “orange rectangle” was marked as
“Restricted Area”,
Due the “Military exercise”.

Your Notes:

Context of SAA: UAS Traffic Management (UTM) (2.5)

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

As for the planes there is ATM, the similar concept is applied for UAS, The UAS Traffic Management system is established by “EASA” in EU,

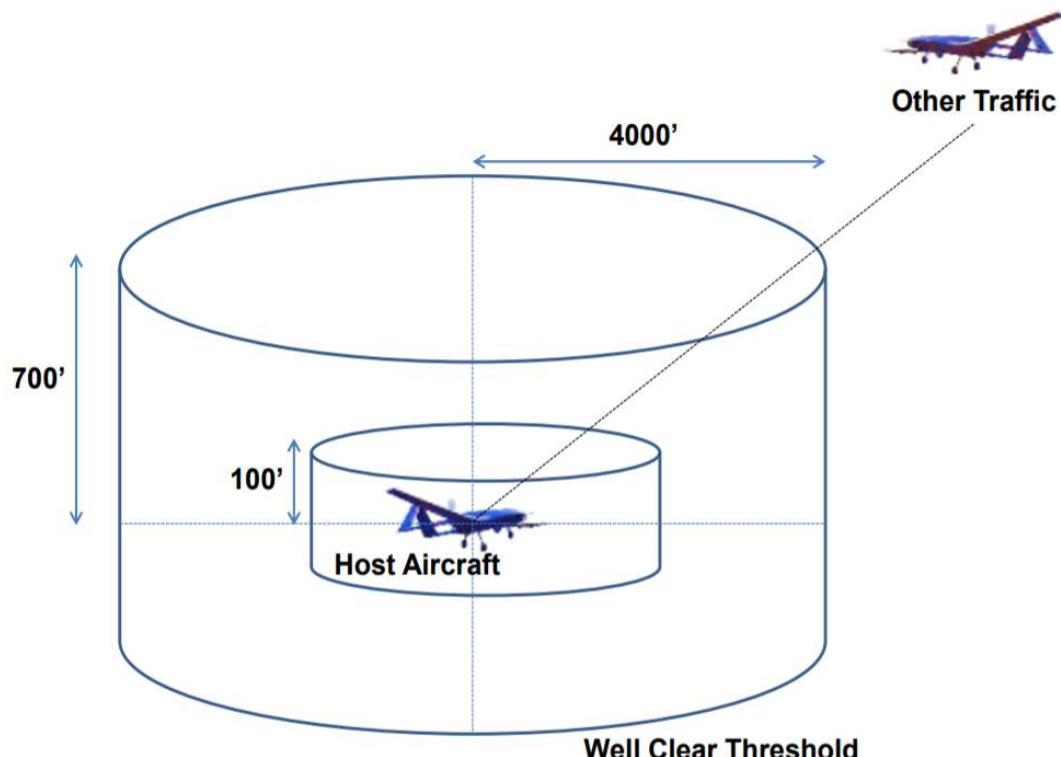

You can see examples of UAS operations:

1. Free flight,
2. Corridor like navigation,
3. Authority enforcement,

The latest has been implemented in our work

Your Notes:

Context of SAA: Goal in controlled airspace: Remain well clear

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The aviation is using “Well clear distance”

The bigger barrel is called “Well clear margin”

Which is considered as “warning zone”

No plane should enter that zone

The smaller barrel is called “near miss margin”,

Entrance is considered as a “serious incident”

Your Notes:

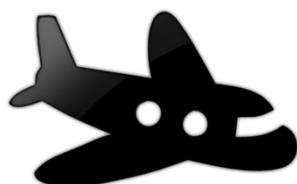

Context of SAA: Actors introduction

UAS

Adversary

Intruder

Static obstacle

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

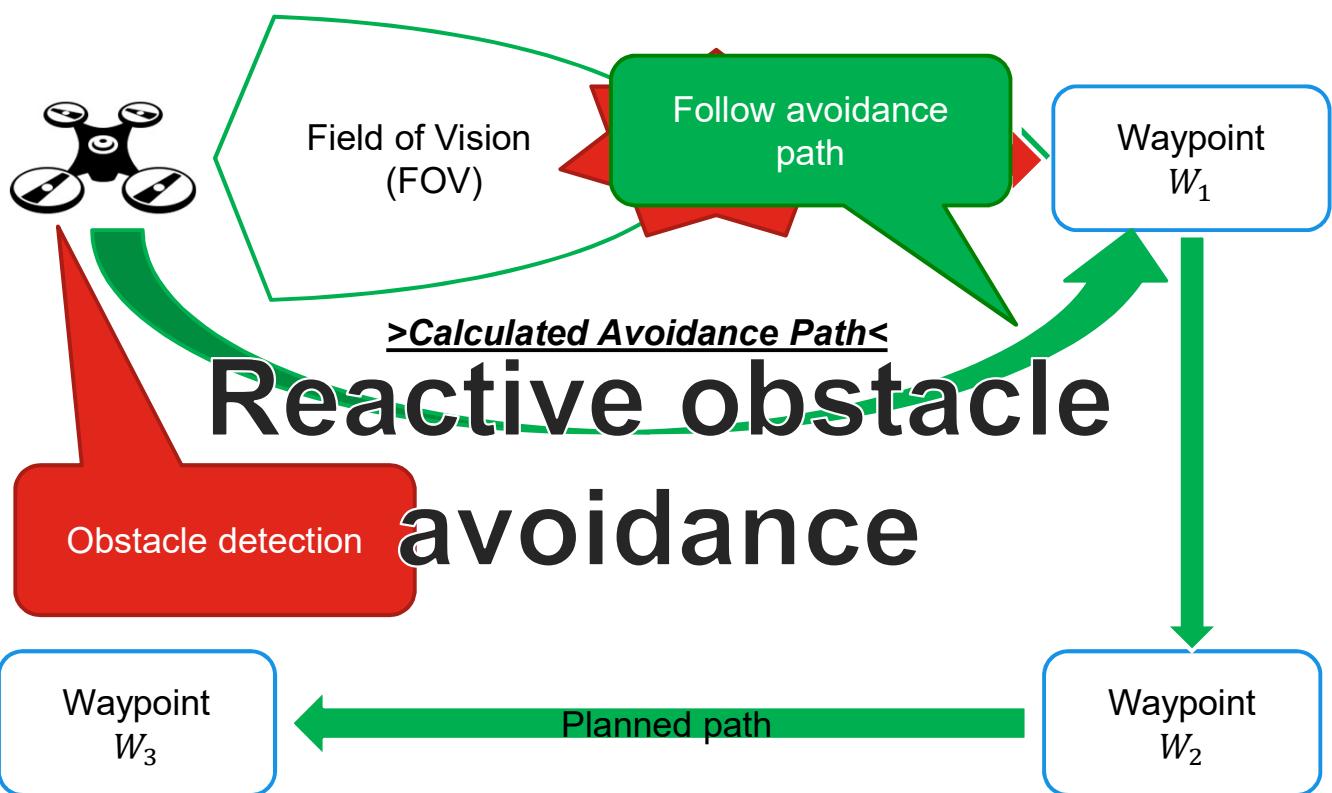

The **UAS** is interacting with **obstacles**:

- **Static** not changing position with time, like buildings,
- Moving which are not trying to harm us – **Intruders**,
- Moving which are trying to harm us – **adversaries**,

Note: The work does not consider “adversaries”,

Your Notes:

Context of SAA: Reactive Sense & Avoid

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

UAS usually flies mission given as a ordered list of “Waypoints”, the UAS is solving:

1. **Reactive Avoidance** – immediate threat,
2. **Preemptive Avoidance** – long term threat,

The example shows implementation of both,

1. UAS spots an obstacle
2. The long term path is not feasible
3. Newly calculated avoidance path is taken

Your Notes:

Problems in Detect & Avoid:

Explained as a story

Incremental problem definition

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Now lets define the problem which is going to be solved,

Your Notes:

How this gentleman gets into the Fine Restaurant

[1]https://commons.wikimedia.org/wiki/File:Le_restaurant_V%C3%A9ry_-_ext.png

[2]https://commons.wikimedia.org/wiki/File:A_gentleman_walking_towards_the_left_and_drawing_his_sword_from_the_sheath,_wearing_a_plumed_hat_and_boots_with_spurs,_MET_DP629192.jpg

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

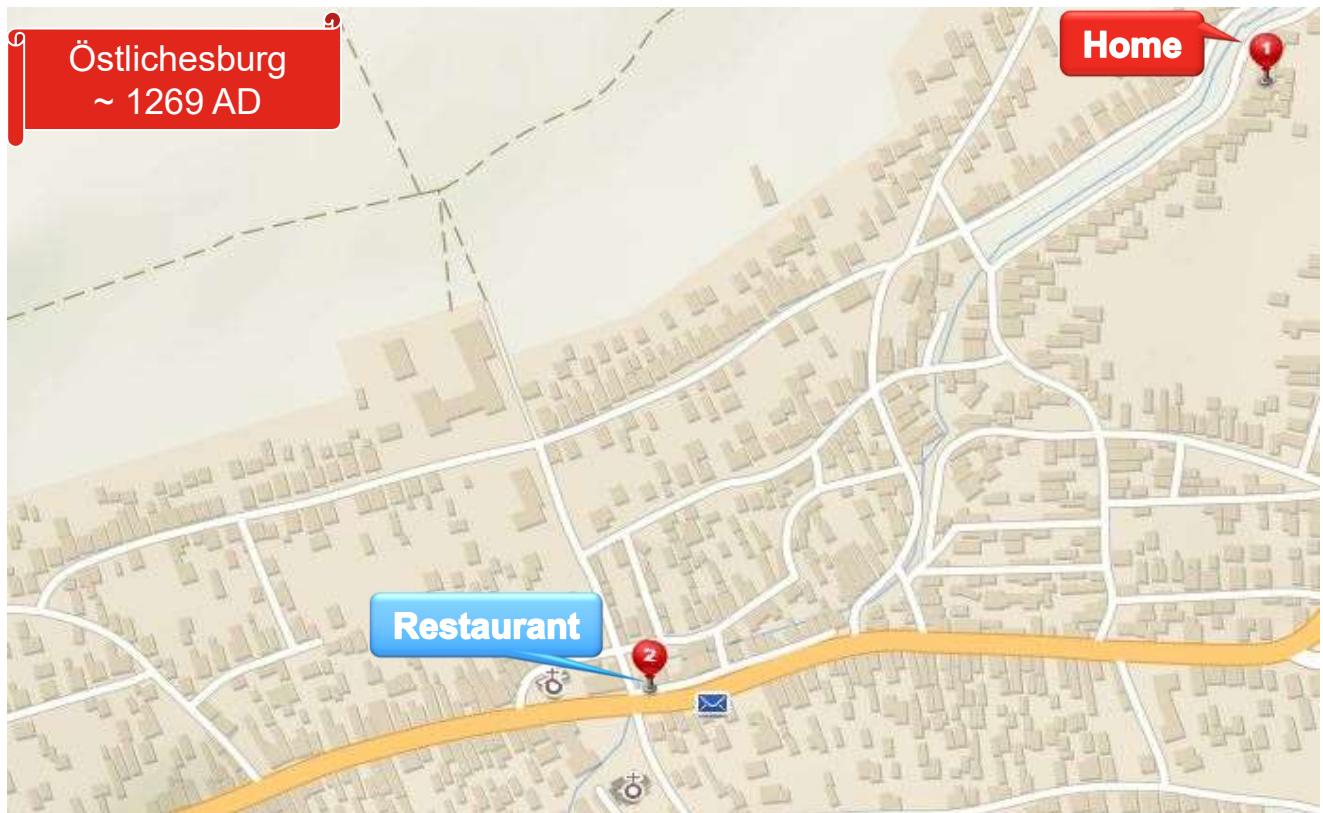

Speech:

The obstacle avoidance can be taken as a “trip to a pub”,

Lets help this gentleman get into the fine restaurant,

Your Notes:

How to get to the fine restaurant ?

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

We have a simple mission get from the home (red),
To the “Fine restaurant” (blue),

Your Notes:

No problem, I know a map of my surroundings

[P1] Path planning problem:

1. Get MAP
2. PLAN then EXECUTE the PATH

Path to
restaurant

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Honeywell
THE POWER OF CONNECTED

Speech:

First is “Path planning problem”, we know everything,
We just need stick to the plan.

Your Notes:

Forget your map, know the restaurant location

[P2] Evolving world:

1. Obtaining knowledge over time
2. Continuous Decision Making

My Position

Field of Vision

GOAL

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

I have forgotten my map at home, I need to use my eyes,
“Sensor system” to scan some surroundings,
I am forced to do “Continuous decision making” and adapt.
I am limited by my field of the vision (black box)

Your Notes:

I get to the first intersection, now what ?

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Because I am lazy I am changing my path only on
“Decision points” (red circle),
I look around and I see three possible ways,

Your Notes:

Look around, get know to your surroundings

This PATH can get me Closer

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

I choose the most promising path according to

“Cost function”,

I will continue along the way

Your Notes:

Walk a little more, get closer to the Restaurant

Rinse and repeat

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

I reached the next decision point,
I look around and I see three possible ways,

Your Notes:

Now Gentleman can see the Restaurant

GET to the Restaurant

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

I choose to go down to my “cost function”,
I do next “sensor scan”,
I can see the restaurant,

Your Notes:

Enjoy a Pint

[P2] Evolving world:

1. SEMI-Optimal navigation to GOAL
2. Less optimal than [1]

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

European
Commission

Honeywell
THE POWER OF CONNECTED

Speech:

The “Evolving world” leads to “semi-optimal” problem solution,
Where the path between “decisions points” is “optimal”,
According to the “cost function”
This is getting closer to real world navigation where we are limited
by our “field of vision”.

Your Notes:

You are NOT alone on the streets !

[P3] Intruder:

You need to avoid:

Carriages and Other people

You can hurt others !

[P3] Intruder:

Reactive obstacle avoidance

Ingredients:

1. Intruder Position
2. Intruder Velocity
3. Own position and velocity

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

There are others around us, lets call them “intruders”,
 They are moving, they can harm us, but don’t want to,
 We know their position, heading and body mass,
 For sure, we want to avoid them,

Your Notes:

Multiple source of information – Data Fusion

[P3] Data fusion:

So much Information ...

So many Whispers ...

Need Validation ...

Much Verification ...

[P3] Data Fusion:

Decisions under uncertainty

1. Determine what is truth
2. Consider all information
3. Rank your sources worth

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

You have **contraindicating** data,

The map is outdated, the pub was moved,

You need to determine what is the true,

You need to fuse data in “Data fusion”,

Your Notes:

Vigilantes & Grannies – Static restriction areas

[P3] Static restrictions:

Vigilantes will kill you ...

Grannies will tell your grandmother

[P3] Static restrictions:

**You can break it, but you will pay
TERRIBLE PRICE !**

Try to avoid all restricted areas

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

When we managed to avoid intruders, the problem is,

Still standing folk, or “static restrictions”,

There are vigilantes they will fine you,

They are considered “hard constraints”,

There are grannies who are just going to tell on you,

They are considered “soft constraints”,

The parallel are the airspace restrictions,

Your Notes:

Try to avoid static restrictions areas !

[5] Static restrictions:

Avoid them all !

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

European
Commission

Honeywell
THE POWER OF CONNECTED

Speech:

Try to avoid “static restrictions”, take long detour (red line)

Note:

The path is semi-optimal (continuous-decision making) with given restrictions

Your Notes:

How about weather ?

[P4] Weather:

Östlichesburg winter very harsh,
On the other hand,
Östlichesburg summer even
Harsher

[P4] Weather:

Harsh Weather Avoid NOW !

Maybe you will need to break some restrictions

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

European
Commission

Honeywell
THE POWER OF CONNECTED

Speech:

We try to avoid harsh weather conditions, which acts like:

1. “Moving constraint”, or,
2. “Static constraint”,

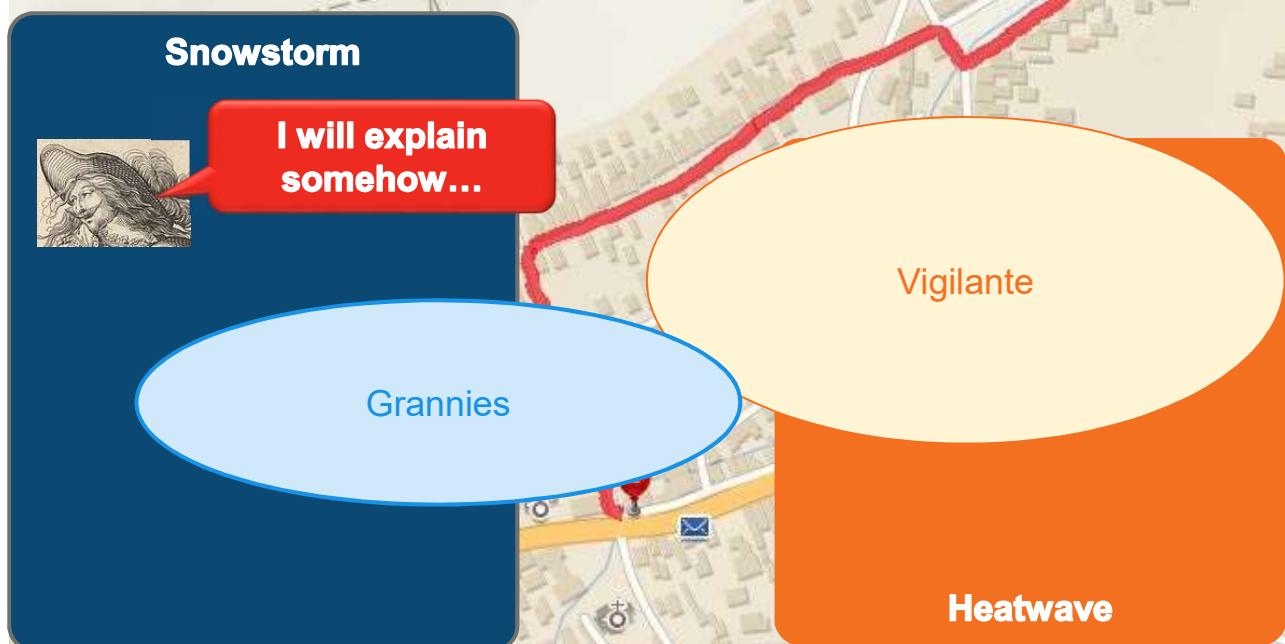

Some prioritization needs to be implemented in our,
“Data fusion”,

Your Notes:

Rather get caught, than catching cold ...

[P4] Weather:
You will avoid Snowstorm,

But you will answer to Grandmother call ...

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The prioritization of “constraints” is like follow:

Rather get yelled by granny than catching a cold

Note:

The red path is crossing grannies territory, breaking “soft static constraint”

Stick to the rules !

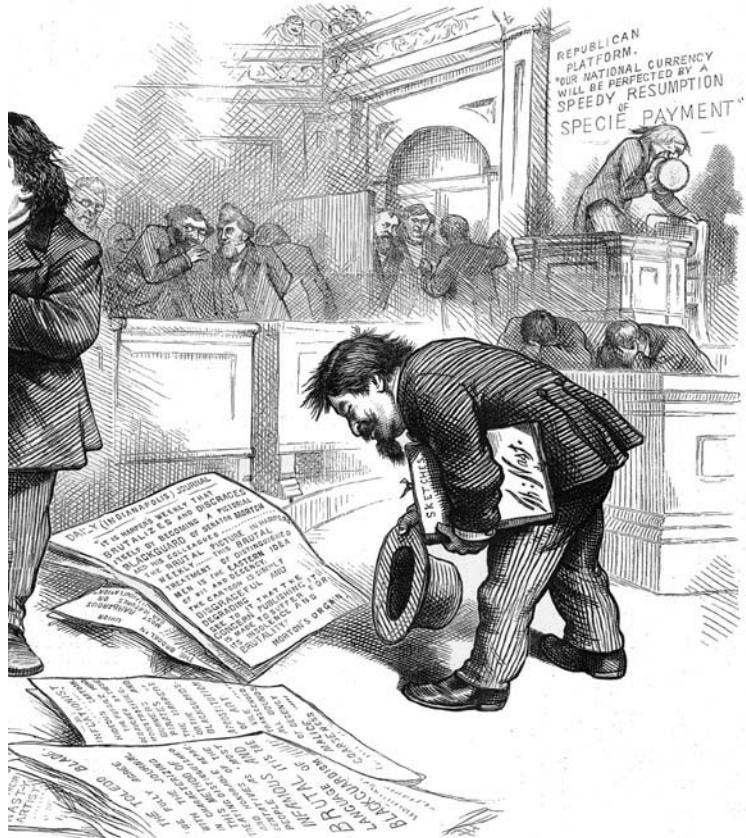

[P5] Rules:

Obey rules while walking

[P5] Rules:

Stick to Written and unwritten rules ...

Necessity
for integration into
traffic,
society,
air space

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

It is necessary to obey the authority, in traffic, society,

Especially in “Airspace”,

The different airspaces implements different rules

Your Notes:

Formal problem specification

1/2

The UAS is operating in space classified into four distinctive subsets:

$$\text{SpaceClassification} : y \in \text{Space} \mapsto s \in \{\text{Free}, \text{Restricted}, \text{Occupied}, \text{Uncertain}\} \quad (4.10)$$

The space classification is coming from data fusion procedure:

$$\begin{aligned} \text{DataFusion} : & \left[\begin{array}{l} \text{InformationSource}_1 \times \\ \text{InformationSource}_2 \times \\ \times \dots \times \\ \text{InformationSource}_l \times \\ \text{SensorFusion}(\dots) \times \\ \text{Weather}(\dots) \\ \text{position} \times \\ \text{fixed time } t_{fix} \times \\ \text{dataFusionParameters} \end{array} \right] \\ & \rightarrow \begin{cases} \text{Free}(t_{fix}) \\ \text{Occupied}(t_{fix}) \\ \text{Restricted}(t_{fix}) \\ \text{Uncertain}(t_{fix}) \end{cases} \quad (4.19) \end{aligned}$$

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Let say that UAS classifies for every time operational 3D space into four categories:

1. Free -where it can move
2. Occupied – where crash happens,
3. Uncertain – out of our knowledge
4. Restricted – other threat,

The space classification (4.10) is result of “Data fusion” (4.19)

Note:

The data fusion will be discussed later,

Your Notes:

Formal problem specification

2/2

UAS will fly a **Mission** given as ordered set of waypoints:

$$Mission = \left\{ \begin{array}{l} waypoint_1, waypoint_2, \dots, waypoint_m : \\ \forall_{i=1 \dots m} waypoint_i \in Space \end{array} \right\}, \quad m \in \mathbb{N}^+, m \geq 2 \quad (4.6)$$

The goal is to have **path** satisfying:

$\forall t \in [missionStart, missionEnd] :$

$$distance(x(t), Occupied(t), t) \geq safetyMargin \quad (4.21)$$

Under the **assumptions**:

- 1. Filtered sensor reading are available.
- 2. There are no moving obstacles (intruders) [Relaxed P3]
- 3. The movement takes place in unrestricted airspace [Relaxed P5]
- 4. The mission consist of a set of reachable waypoints
- 5. The UAS is moving with constant velocity [Relaxed P5]

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The UAS is flying a mission given as a set of ordered waypoints (4.6),

The goal is to keep the distance to any occupied space greater than some margin (4.21),

Under following assumption:

- 1. Sensor readings are clear,
- 2. There are no intruder for now,
- 3. The airspace is unrestricted,
- 4. The waypoints are reachable,
- 5. UAS constant speed,

Note:

Some assumptions are relaxed over time,

Your Notes:

Incremental problem definition:

[P1] Basic Avoidance

<i>KnownWorld:</i>	= <i>SensorFusion(t)</i> $\forall point \in KnownWorld(t)$
	= <i>Free(t) \cup Occupied(t) \cup Unknown(t)</i>
<i>Mission:</i>	= $\forall waypoint \in Mission$ are reachable
<i>Sensors:</i>	= { <i>LiDAR</i> }
<i>SensorFusion:</i>	= { <i>Classification function</i> }
<i>HFlightConstraints:</i>	= { <i>vehicle dynamic</i> }

1. Known world - consisting from Free, Occupied, Unknown sets.
2. Mission - Assumptions 1-5 are valid.
3. Sensors - LiDAR sensor is introduced as source of information.
4. Sensor fusion - classification function implementation
5. Hard Flight constraints - UAS dynamic only.

Problems addressed:

- Navigation Loop Implementation (sec. 6.6.2).
- Avoidance Loop Implementation (sec. 6.6.1).

© 2019 by Honeywell International Inc. All rights reserved.
 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The “Basic avoidance problem” is like follow:

- 1.UAS is equipped with *LiDAR* sensor, flies over open space with static obstacles only,
- 2.The “Restricted space” is out of question,
- 3.*There is only “vehicle dynamic constraints”*

The following needs to be established:

1. Avoidance loop – for immediate decisions (6.6.2)
2. Navigation loop - for decision point management (6.6.1)

Your Notes:

Incremental problem definition:

[P2] Intruders Introduction

<i>KnownWorld:</i>	= <i>SensorFusion(t)</i> $\forall point \in KnownWorld(t)$
	= <i>Free(t)</i> \cup <i>Occupied(t)</i> \cup <i>Unknown(t)</i>
<i>Mission:</i>	= $\forall waypoint \in Mission$ are reachable
<i>Sensors:</i>	= {LiDAR, ADS - B }
<i>SensorFusion:</i>	= {Advanced joint sets}
<i>HFlightConstraints:</i>	= {vehicle dynamic}
<i>HardConstraints:</i>	= {intruder corridors}

1. Sensors - ADS-B added enabling intruder detection.
2. Sensor fusion - union of obstacle space and individual intruder spaces.
3. Hard constraints - intruder corridors, changing over time.

Problems addressed:

- Intruder Intersection Models (minimal operation requirements achieved): Linear Intersection Model (app. C.1), Body-volume intersection (app. C.2), Maneuverability uncertainty intersection (app. C.3).
- Flight Corridors (sec. 6.5.3).

© 2019 by Honeywell International Inc. All rights reserved.
 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Let us introduce intruders,

1. We read their position over ADS-B broadcast,
2. The “Sensor fusion” needs to fuse two sensors,
3. “Flight corridors” as added “hard constraints”,

Problems to be addressed:

1. How to model “intruder intersection” in “operational space”,
2. including future “corridors”.

Your Notes:

Incremental problem definition: [P3] Static restrictions

<i>KnownWorld:</i>	$= DataFusion(t) \forall point \in KnownWorld(t)$
	$= Free(t) \cup Occupied(t) \cup Unknown(t) \cup \text{Restricted}(t)$
<i>Mission:</i>	$= \forall waypoint \in Mission \text{ are reachable}$
<i>Sensors:</i>	$= \{LiDAR, ADS - B\}$
<i>SensorFusion:</i>	$= \{\text{Advanced joint sets}\}$
<i>InformationSources:</i>	$= \{\text{TerrainMap, ObstacleMap, FlightRestriction}\}$
<i>DataFusion:</i>	$= \{\text{Advanced data fusion}\}$
<i>HFlightConstraints:</i>	$= \{\text{vehicle dynamic}\}$
<i>HardConstraints:</i>	$= \{\text{intruder corridors, terrain, obstacles}\}$
<i>Softconstraints:</i>	$= \{\text{protection zones}\}$

1. Known world - added restricted space portion evolving over time
2. Information sources - added *Obstacle Map* (fig. 6.13), *Visibility Rating Concept* (fig. 6.12) and *Static Constraints* (sec. 6.5.3).
3. Data fusion - the rating implementation of the data fusion (sec. 6.5.4).
4. Hard constraints - added obstacles and terrain constraints.
5. Soft constraints - added airspace restrictions and geo-fencing/

© 2019 by Honeywell International Inc. All rights reserved.
 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Let us add “static constraints” and restrictions, originating from:

1. Terrain Map – from our previous flights
2. Obstacle Map – from future UTM,
3. Flight restrictions – from airspace authority,

The data fusion now needs to handle prioritization,

Evaluate the threat potential,

Note:

Refer to the map from the introduction for “restricted airspace”.

The supplement ratings needed to be introduced, like visibility (6.13) and static constraints (6.5.3)

The final form of data fusion has been outlined (6.5.4)

Your Notes:

Incremental problem definition:

[P4] Dynamic restrictions

<i>KnownWorld:</i>	= <i>DataFusion(t) $\forall point \in KnownWorld(t)$</i>
	= <i>Free(t) $\cup Occupied(t) \cup Unknown(t) \cup Restricted(t)$</i>
<i>Mission:</i>	= $\forall waypoint \in Mission$ are reachable
<i>Sensors:</i>	= {LiDAR, ADS - B}
<i>SensorFusion:</i>	= {Advanced joint sets}
<i>InformationSources:</i>	= {TerrainMap, ObstacleDatabase, FlightRestriction, Weather}
<i>DataFusion:</i>	= {Advanced data fusion}
<i>HFlightConstraints:</i>	= {vehicle dynamic}
<i>HardConstraints:</i>	= {intruder corridors, terrain, obstacles, protection zones}
<i>Softconstraints:</i>	= {protection zones}

1. Information sources - the weather adding *moving constraints* (def. 20)
example *Weather Avoidance Case* (app. E.1).
2. Hard constraints - protection zones against severe weather conditions
3. Soft constraints - protection zones against mild weather conditions

© 2019 by Honeywell International Inc. All rights reserved.
 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The weather compliance is necessary for controlled airspace integration, considering the average UAS size,

1. The weather consists of static phenomenon like focused storm or moving phenomenon like wind gusts,

This introduces a new type of “moving constraint” which needs to be accounted from greater range,

2. Depending on the UAS construction and future durability requirements, Some of the weather cases may be ignored, this gives us “soft constraints”.

[Note]

Weather covers all types of constraints due its phenomena variability.

Incremental problem definition: [P5] Rules of the air

<i>KnownWorld:</i>	$= DataFusion(t) \forall point \in KnownWorld(t)$
	$= Free(t) \cup Occupied(t) \cup Unknown(t) \cup Restricted(t)$
<i>Mission:</i>	$= \forall waypoint \in Mission \text{ are reachable}$
<i>Sensors:</i>	$= \{LiDAR, ADS - B\}$
<i>SensorFusion:</i>	$= \{\text{Advanced joint sets}\}$
<i>InformationSources:</i>	$= \{TerrainMap, ObstacleDatabase, FlightRestriction, Weather\}$
<i>DataFusion:</i>	$= \{\text{Advanced datafusion}\}$
<i>HFlightConstraints:</i>	$= \{\text{vehicle dynamic}\}$
<i>SFlightConstraints:</i>	$= \{\text{airspace, rules of the air}\}$
<i>HardConstraints:</i>	$= \{\text{intruder corridors, terrain, obstacles, protection zones}\}$
<i>Softconstraints:</i>	$= \{\text{protection zones}\}$

1. Soft flight constraints - different behavior in *airspace classes* added, *rules of the air* implementation added, introduction in *UTM Implementation* (sec. 6.7), *Rule Engine for UAS* (sec. 6.8.1) and *Rule Implementation* (sec. 6.8.2).

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

There is special type of “hybrid automaton” called, “movement automaton”, which provides sufficient abstraction to be reused on different platforms

“Our movement automaton” is based on work of, “Emillio Frazolli”,

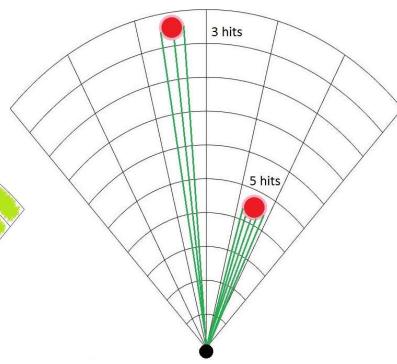

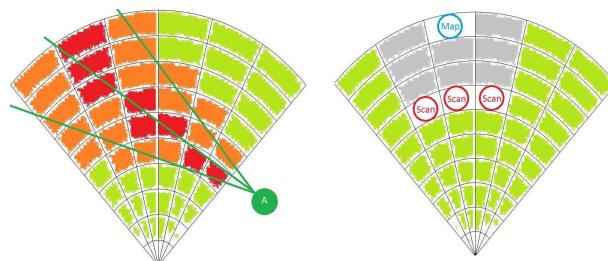

Movement automaton have the finite set of possible, movements, which supports determinism (green picture)

Note:

In the picture you can see the example of used movement set [red plane is origin], [cyan/magenta plane after movement]

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The reach set defines where can UAS fly from initial position in given time frame,

We want to have finite count of possibilities to guarantee finite time solution,

The “lattice trajectory tree” fulfils this purpose,

The work of LaValle, Gessel, and, Esposito are used as base for our algorithm.

Note:

On the picture the “reach set approximation” for truck in different starting positions

Your Notes:

Proposed Framework:

Overview

Avoidance Run

UTM Implementation

Rule Engine

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

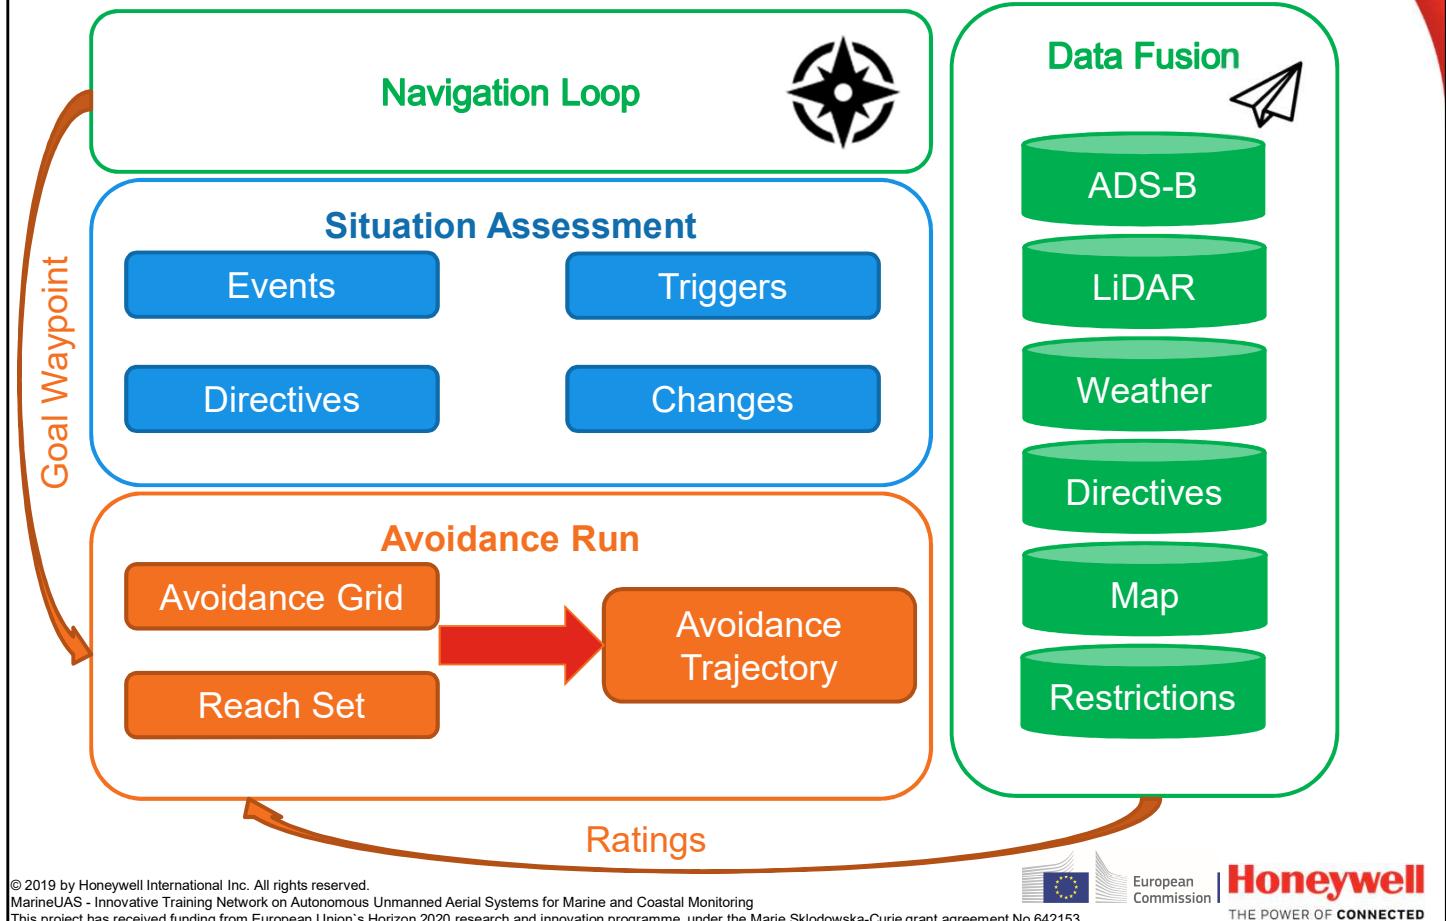

Speech:

That's all for the introduction,
Let us get to the proposed framework,

Your Notes:

Proposed framework Overview

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

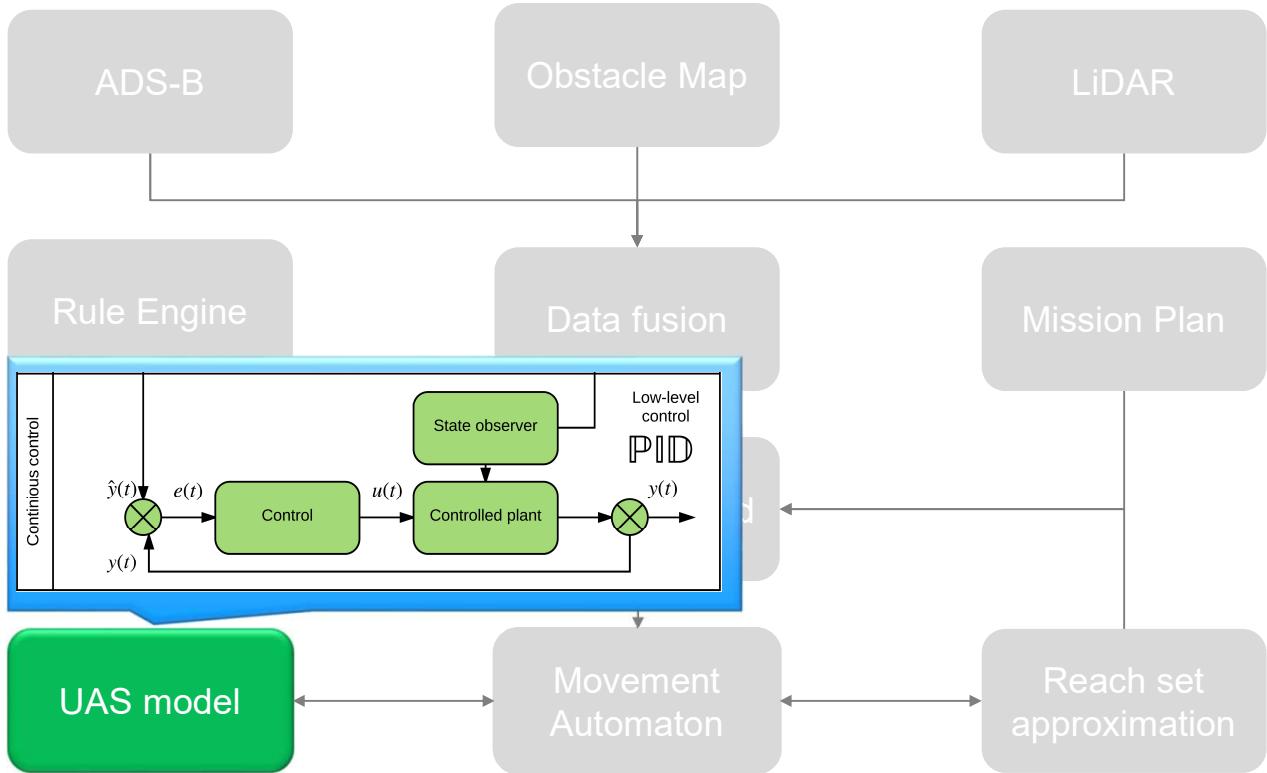

The framework works like follow:

1. The entry point is Data fusion (green <plane> box),
2. Data fusion gives “Situation overview” to “Avoidance Run”,
3. “Avoidance Run” (orange box) stores the situation in “Grid”,
4. The “Situational Assessment” (blue box) based on “Goal waypoint” and “rules” selects the most feasible “short-term avoidance trajectory” from the reach set.
5. The “Navigation loop” is responsible for long term navigation.
6. The movement automaton is responsible for “reference path translation”

Then let us look on details.

Your Notes:

UAS model

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The controlled plant (sec. 6.2) for UAS model, is continuous time system, (dramatic pause, click)

Your Notes:

UAS model:

3D unicycle (6.2.2)

The **UAS model** is defined like follows:

$$\text{state} = [x, y, z, roll, pitch, yaw]^T \quad (6.1)$$

$$\text{input} = [v, \omega_{roll}, \omega_{pitch}, \omega_{yaw}]^T \quad (6.2)$$

$$\begin{aligned} \frac{dx}{dtime} &= v \cos(pitch) \cos(yaw); & \frac{droll}{dtime} &= \omega_{roll}; \\ \frac{dy}{dtime} &= v \cos(pitch) \sin(yaw); & \frac{dpitch}{dtime} &= \omega_{pitch}; \\ \frac{dz}{dtime} &= -v \sin(pitch); & \frac{dyaw}{dtime} &= \omega_{yaw}; \end{aligned} \quad (6.4)$$

The **state** is position in GCF (x,y,z) and orientation in GCF (roll, pitch yaw).

The input is linear velocity (v) and angular speed in LCF (ω_{roll} , ω_{pitch} , ω_{yaw})

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The UAS model is simple 3D unicycle,
 With position (GCF) and orientation (GCF) as a state (6.1)
 And control input as scalar velocity and angular velocity (6.2),
 The model is then given by set of equations (6.4).

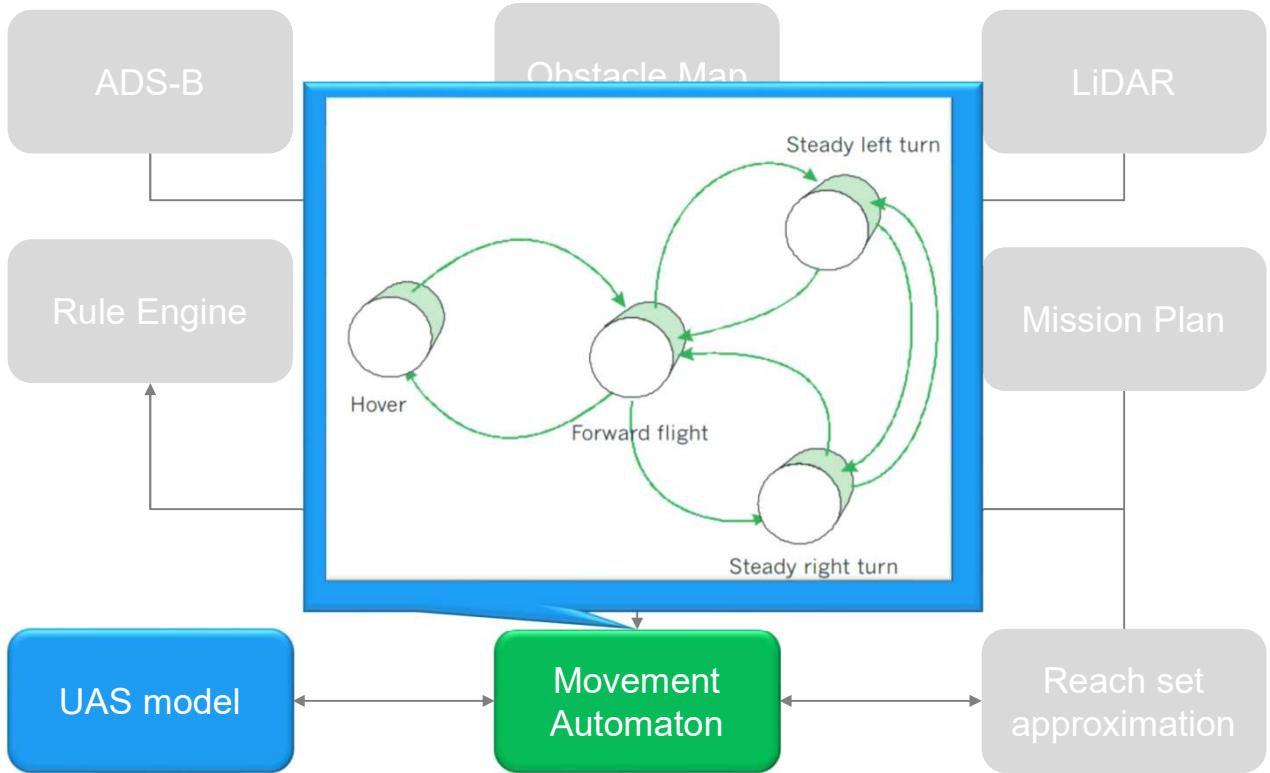

Note:

The simple model was used to ease reach set estimation experimentation,

The angular velocities are decoupled,

Your Notes:

Movement Automaton

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The UAS is controlled via Movement automaton

Movement automaton consumes commands – movements,

In the picture you can see example of simple Copter movement automaton, with four movements,

Note:

The movement automaton is just hybrid automaton with enforced state changes.

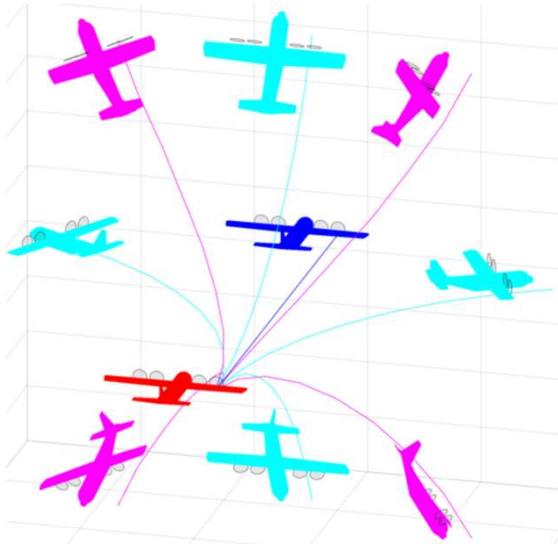

Your Notes:

Movement Automaton: Movement set (6.2.3)

A **movement set** have been implemented containing movements lasting 1s:

$$MovementSet = \left\{ \begin{array}{l} Straight, Left, Right, Up, Down, \\ DownLeft, DownRight, UpLeft, UpRight \end{array} \right\} \quad (6.11)$$

The **movement execution**, with **initial state** represented as a red plane, looks like follow:

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The movement set is a set of automaton states,

For our model there is a possibility to derive nine (9) “elementary movements” (6.11),

In the picture the red plane shows the position before movement application, other colors after movement application

Note:

Similar movement set can be achieved for many UAS models,

Movement Automaton: Trajectory (6.2.3)

A buffer is an ordered list of movements to be executed by UAS:

$$\text{Buffer} = \left\{ \text{movement}(j) : \begin{array}{l} \text{movement}(j) \in \text{MovementSet}(\text{eq.6.11}), \\ j \in 1 \dots n, n \in N^+ \end{array} \right\} \quad (6.12)$$

The trajectory for some initial state(0) and buffer is given as:

$\text{Trajectory}(\text{state}(0), \text{Buffer}) =$

$$\left\{ \begin{array}{l} \text{state}(0) = \text{state}(0), \\ \text{state}(1) = \text{applyMovement}(\text{state}(0), \text{movement}(1)), \\ \text{state}(2) = \text{applyMovement}(\text{state}(1), \text{movement}(2)), \\ \vdots = \vdots \\ \text{state}(n-1) = \text{applyMovement}(\text{state}(n-2), \text{movement}(n-1)), \\ \text{state}(n) = \text{applyMovement}(\text{state}(n-1), \text{movement}(n)) \end{array} \right\} \quad (6.13)$$

© 2019 by Honeywell International Inc. All rights reserved.
 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The buffer is created by chaining multiple elementary movements as command chain,

The command chain is stored in Buffer structure (6.12),

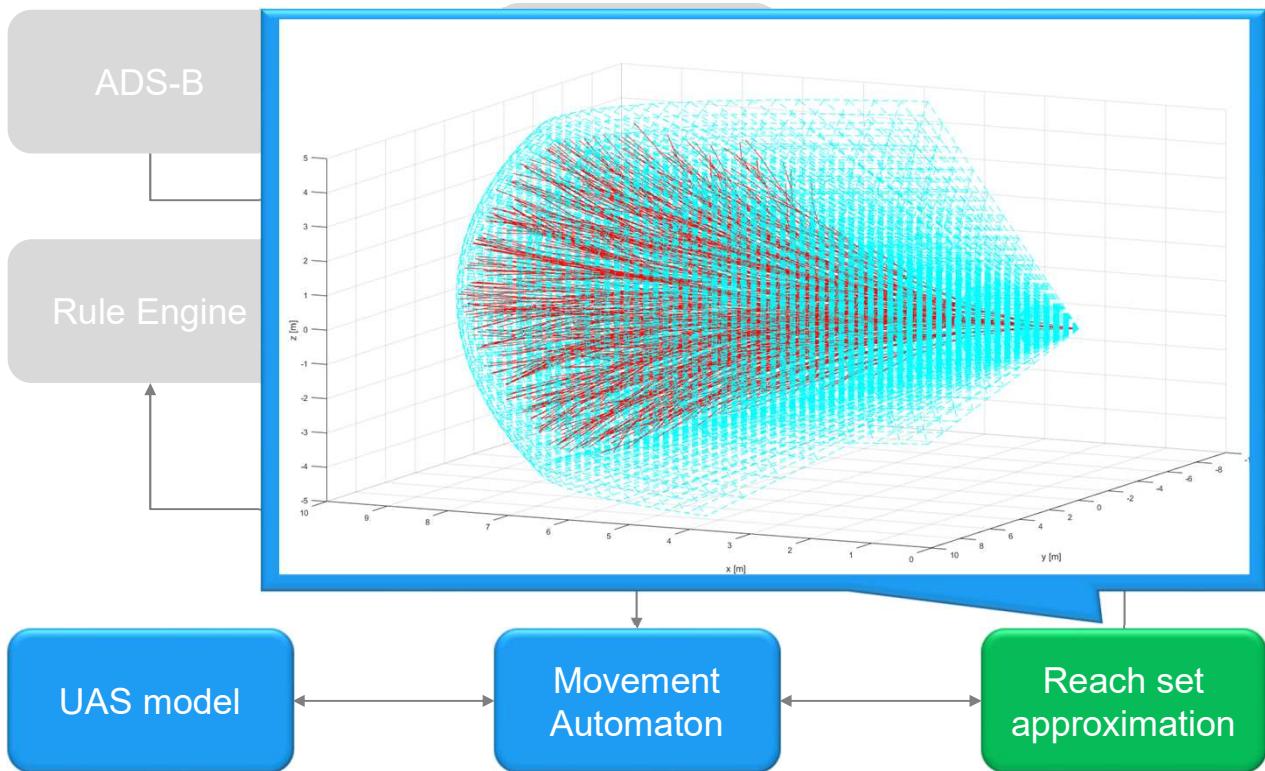

The movement automaton continuously consumes buffer to control UAS over trajectory,

The trajectory for some initial state and buffer is given as,

The chain of the state changes with corresponding movement applications (6.13).

Your Notes:

Reach set approximation

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The Reach set is used for decision making,
It can be imagined as “tree of trajectories”,
Example: Reach set using our method (red) in Field of vision (aquamarine),

Your Notes:

Reach set approximation

Space segmentation – Avoidance Grid (6.3)

An intermediate operational space is segmented into **avoidance grid**:

$$\text{AvoidanceGrid} = \left\{ \begin{array}{l} i \in 1 \dots \text{layerCount} \\ \text{cell}_{i,j,k} : j \in 1 \dots \text{horizontalCount} \\ k \in 1 \dots \text{verticalCount} \end{array} \right\} \quad (6.20)$$

$$\forall \text{cell}_{i,j,k}, \text{cell}_{m,n,o} : \text{cell}_{i,j,k} \cap \text{cell}_{m,n,o} = \emptyset, i \neq o \vee j \neq n \vee k \neq o \quad (6.21)$$

One **cell space portion** is bounded by:

cell.spacePortion = ...

$$\left\{ \begin{array}{l} \text{point} \in \mathbb{R}^3 \text{ where :} \\ \left(\begin{array}{lll} \text{cell.distance}_{start} < \text{point.distance} \leq \text{cell.distance}_{end}, \\ \text{cell.horizontal}_{start}^\circ < \text{point.horizontal}^\circ \leq \text{cell.horizontal}_{end}^\circ, \\ \text{cell.vertical}_{start}^\circ < \text{point.vertical}^\circ \leq \text{cell.vertical}_{end}^\circ \end{array} \right) \end{array} \right\} \quad (6.15)$$

Refer to (def. 11,12)

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The UAS operational space is represented by

“Avoidance grid” (6.20)

Avoidance grid represented in planar coordinates is split into the uniform cells with space portion (6.15)

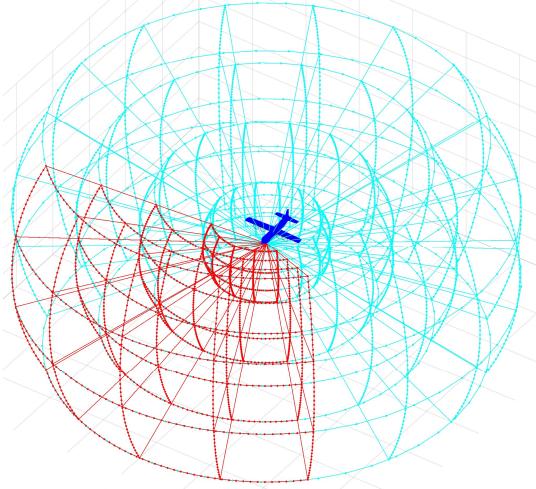

Note:

The space bounded by cells is exclusive (6.21).

Your Notes:

Reach set approximation The RSA definition

In segmented discrete operational space represented as avoidance grid:

The reach set approximation is a set of trajectories with common origin:

$$\text{ReachSet}(\tau, \text{time}_0, \text{state}_0) = \left\{ \text{Trajectory}(\text{state}_0, \text{buffer}) : \begin{array}{l} \text{duration(buffer)} \\ \leq \\ (\text{time}_0 - \tau) \end{array} \right\} \quad (6.23)$$

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The avoidance grid example is denoted by red line, the blue plane is in the center.

Then the Reach set approximation is given as a set of trajectories originating in “initial state” with limited duration (6.23),

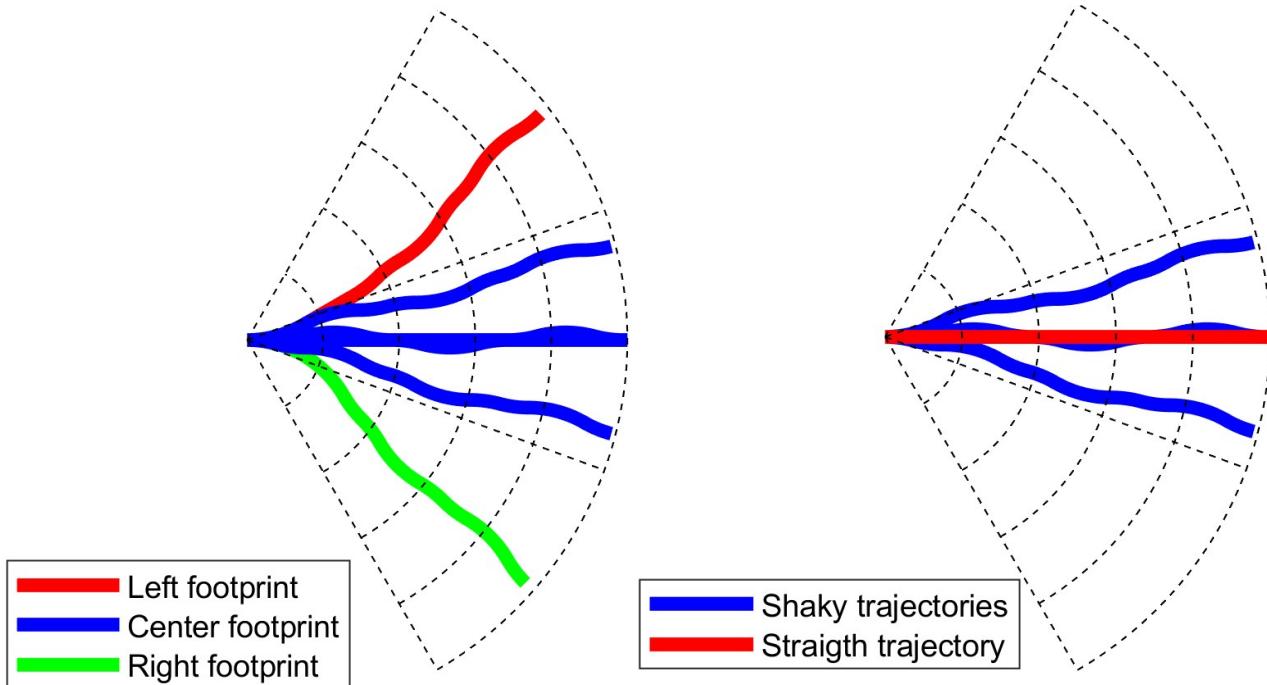

The trajectory is given as a execution of movement chain - “buffer” applied on initial state,

Note:

Refer to section (6.4.1) for detailed explanation.

Your Notes:

Reach set approximation: Trajectory properties (6.4.2)

Coverage – the trajectory footprint

- 6 trajectories 3 unique footprints

Turn ratio – count of turning movements

- Try to minimize turning in reach set !

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The goal is to have **meaning** full trajectories in Reach Set Approximation,

The trajectory relation to the “avoidance grid” is given by its footprint, the set of cells passed by trajectory,

In the left figure you can see six trajectories going over avoidance grid,

There are only three unique **footprints**,

That means we need only 3 of those trajectories,

The right figure shows four trajectories with same footprint

Your Notes:

Reach set Approximation

Property based approximations (6.4.3)

Get the
minimal

discrete trajectory set (RSA)

covering

all possible maneuvers

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The trajectory properties are considered when the candidate trajectory for Reach set approximation is selected,

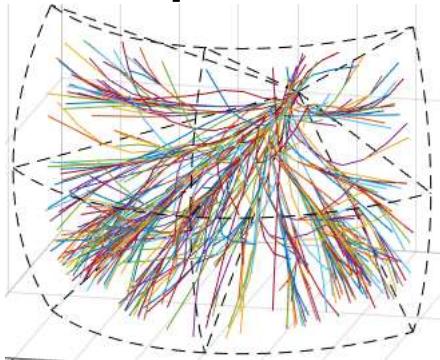

In the figure you can see selection process based on coverage property,

Note:

You can track any property of the trajectory in relation to operational space or airspace, as you will see later,

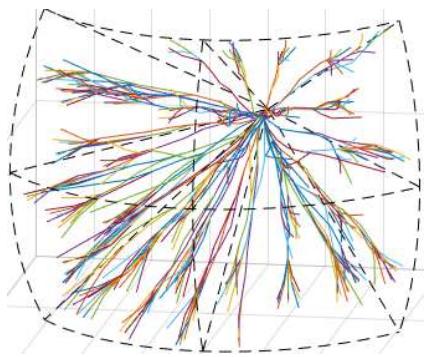

Your Notes:

Reach set approximation: Developed Reach set Approximations 1/2

Coverage-maximizing RSA (6.4.4)

- Contains trajectories with: high coverage rate
- Useful for: intruder/obstacle avoidance
- In: Non-controlled airspace

Turn-minimizing RSA (6.4.5)

- Contains trajectories with: high smoothness
- Useful for: Navigation
- In: Non-controlled airspace

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Following reach set approximations were developed:

1. Coverage maximizing (6.4.4)

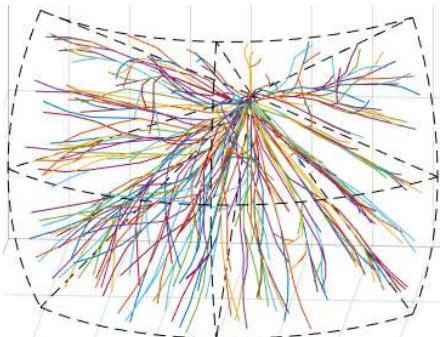

- A. contains trajectories maximizing avoidance capability
- B. Used for intruder/obstacle avoidance
- C. In non-controlled airspace

2. Turn minimizing (6.4.5)

- A. Contains trajectories with minimal turning,
- B. Used for navigation, increases behavior predictability,
- C. Used in non-controlled airspace

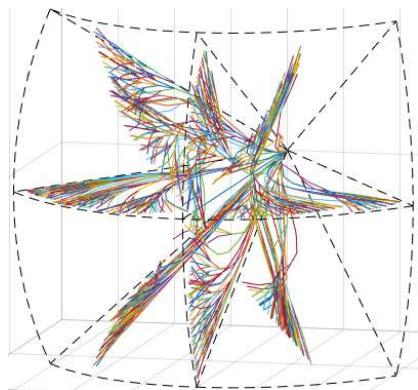

Your Notes:

Reach set approximation: Developed Reach set Approximations 2/2

Combined RSA (6.4.7)

- Contains trajectories with: *TM + CM RSA combination*
- Useful for: *avoidance/navigation*
- In: *Controlled airspace in case of Emergency*

ACAS-like RSA (6.4.6)

- Contains trajectories with: *ACAS behavior*
- Useful for: *Navigation/UTM Resolutions*
- In: *Controlled airspace*

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The idea behind combined RSA (6.4.7) is to have properties of both turn minimizing and coverage maximizing RSA.

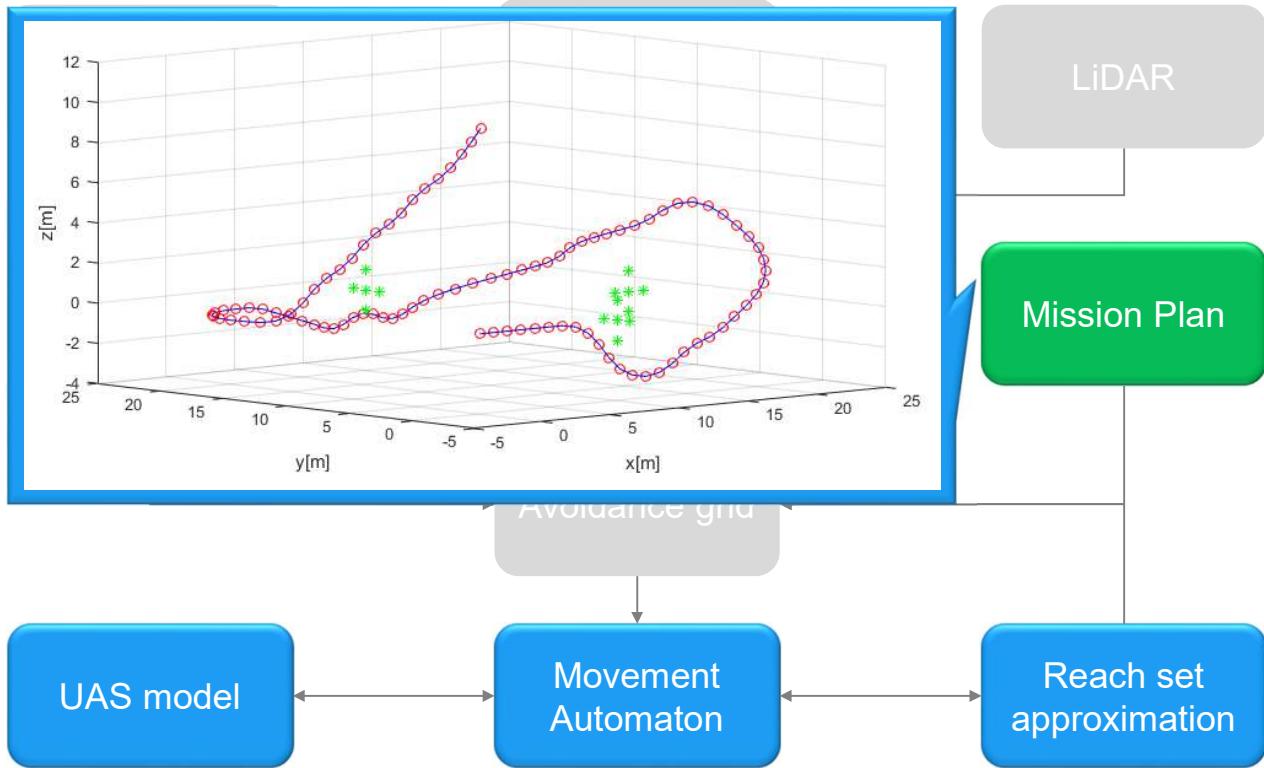

To be compatible with controlled airspace, the “ACAS-like” (6.4.6) RSA was developed to emulate horizontal/ vertical/ cross section separations of modern aircrafts.

Note:

All reach sets are for 3D space

ACAS operational mode can be constrained.

Mission plan

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme, under the Marie Skłodowska-Curie grant agreement No 642153.

Speech:

The navigation algorithm provides navigation goal (purple star).

Then in the reachable space a feasible blue avoidance path is selected from constrained reach set,

The blue star is marked as next decision point,

We fire up Avoidance Run again there

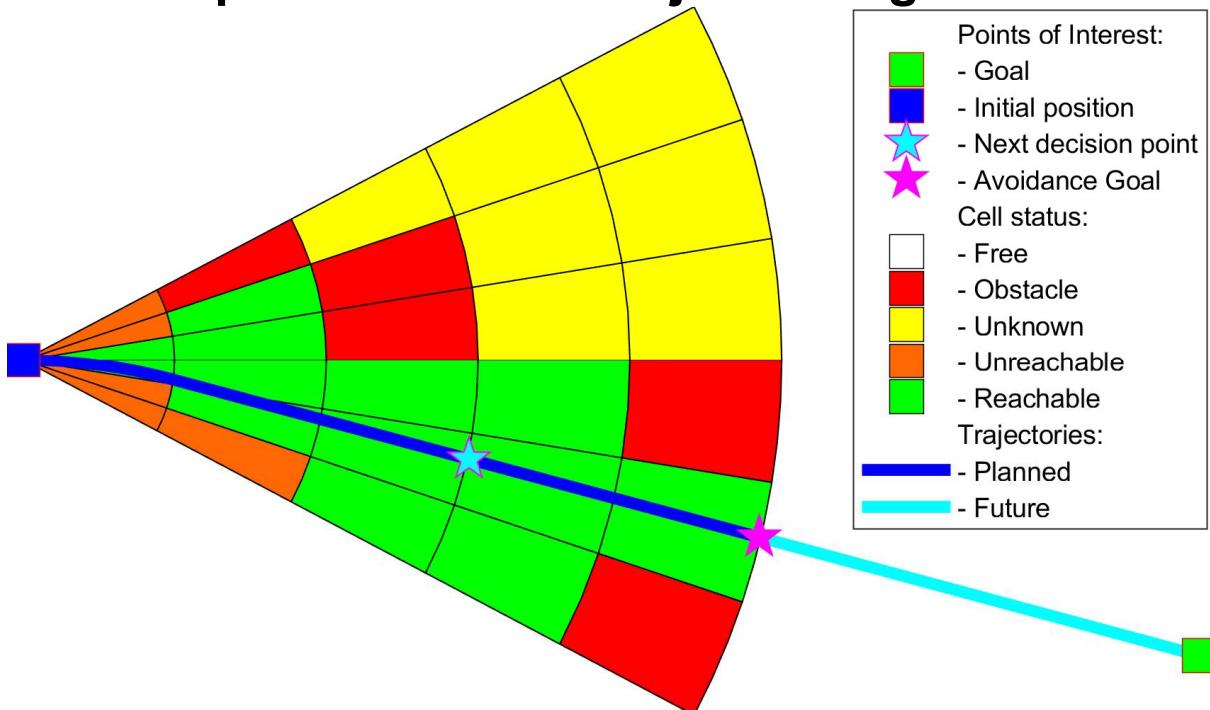

Note:

The path is selected according to the cost function and safety rules

Your Notes:

Mission control run (6.5.2)

Multiple avoidance run joined together

© 2019 by Honeywell International Inc. All rights reserved.
 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The avoidance run is responsible for “Short term navigation”, for long term navigation mission control run is used.

Multiple avoidance runs are executed to create one safe trajectory,

The cyan trajectory is planned from next decision point,

Note:

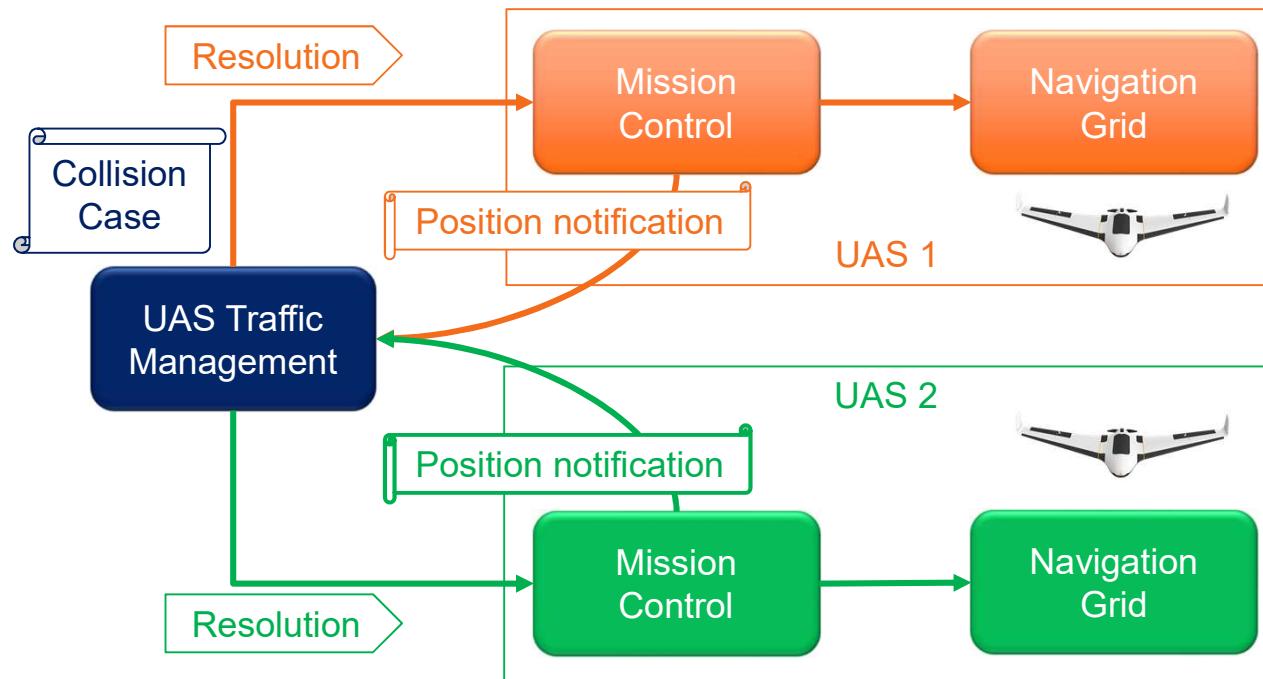

Mission control run is far more complex with magnitude of rules and other mechanisms,

It has been neglected in this presentation for simplicity purpose,

Your Notes:

UAS Traffic Management Concept

- Each vehicle is calculating Collision Cases to nearby vehicles,
- UTM is also calculating Collision Cases to cluster vehicles,
- UTM issues **Resolution advisories** or separation rules to prevent collision

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Honeywell
THE POWER OF CONNECTED

Speech:

That was all for framework,

We need to make multiple instances to cooperates, for UAS to be airworthy,

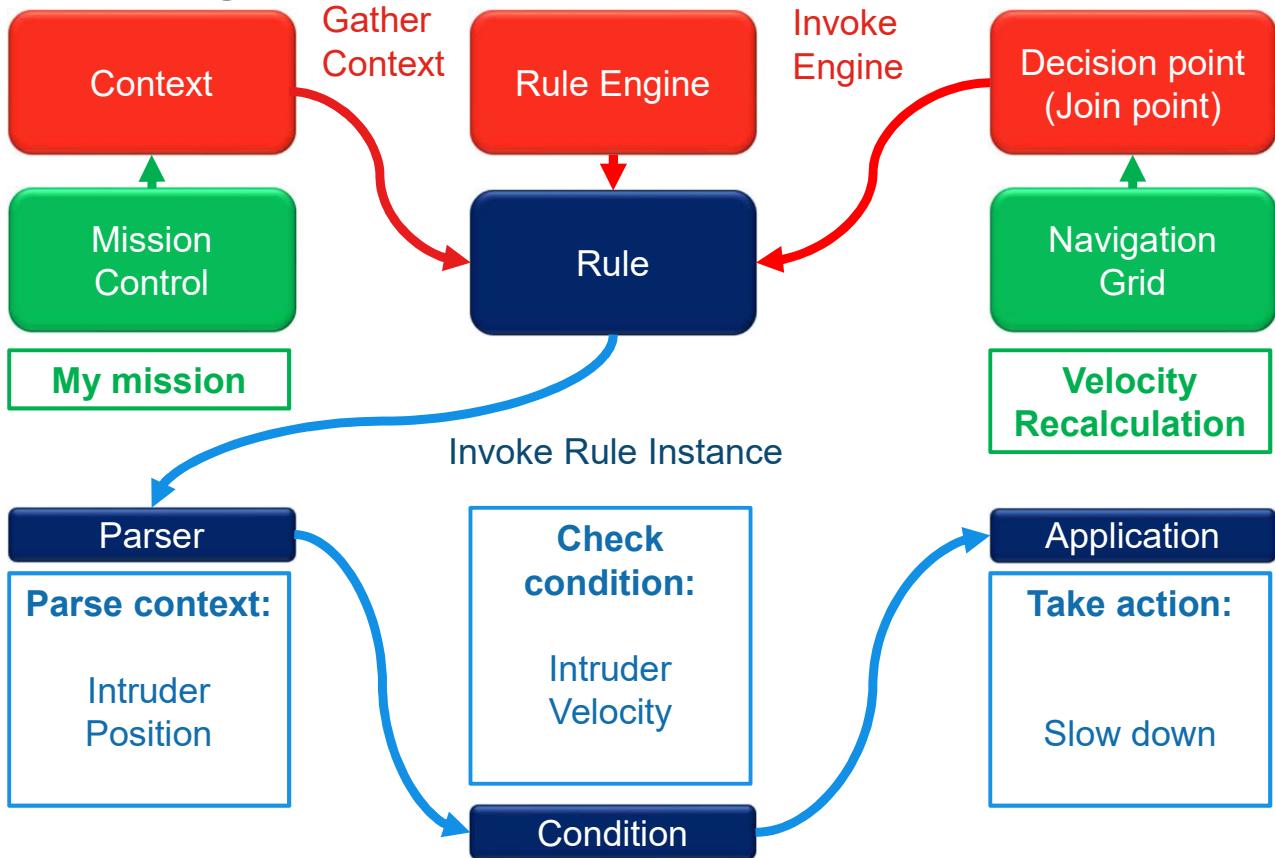

This schematic shows a concept of centralized UTM,

UTM is receiving position updates from aircrafts,

If UTM detects collision its sends “Collision Resolutions”,

Your Notes:

Rule engine

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Firstly, I will show you two scenarios for obstacle avoidance and weather avoidance

Your Notes:

Scenario (7.3.3) Maze

Lets call it “Standard pizza delivery scenario”

The “blue plane” is flying over the maze to the green square waypoint,

The blue line is already flew trajectory

The red line is planned trajectory for actual decision point

The non convex obstacles are fed to “LiDAR” sensor

As you can see the approach has maze solving capabilities

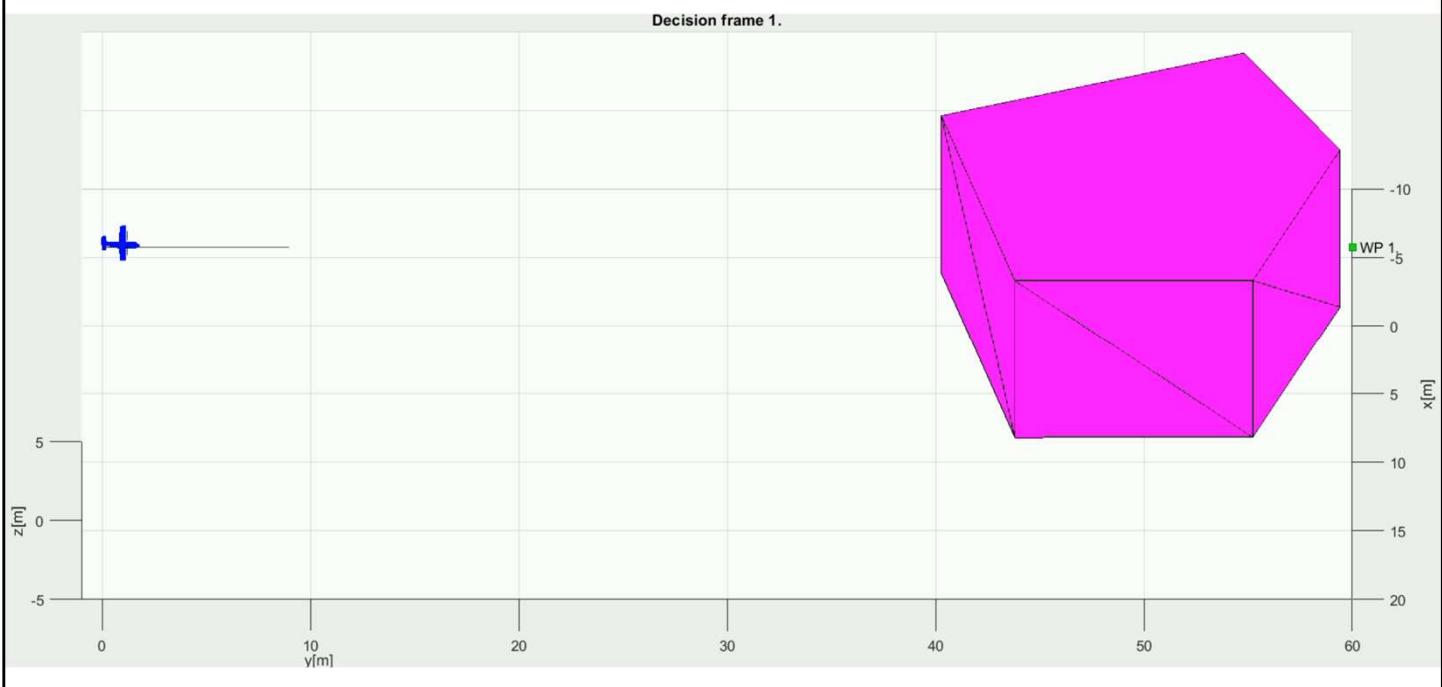

Note:

The UAS is capable to fly over buildings, The framework and reach sets are primarily 3D

The UAS is fed only over Sensor simulation, it does not know the mission plan or obstacle layout

Your Notes:

Scenario (7.3.4): Storm

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The blue plane is approaching magenta storm,

The storm is considered as moving constraint

The plane avoids storm

Your Notes:

Rules of the Air Simulations:

Converging Maneuver

Head On Approach

Overtake

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

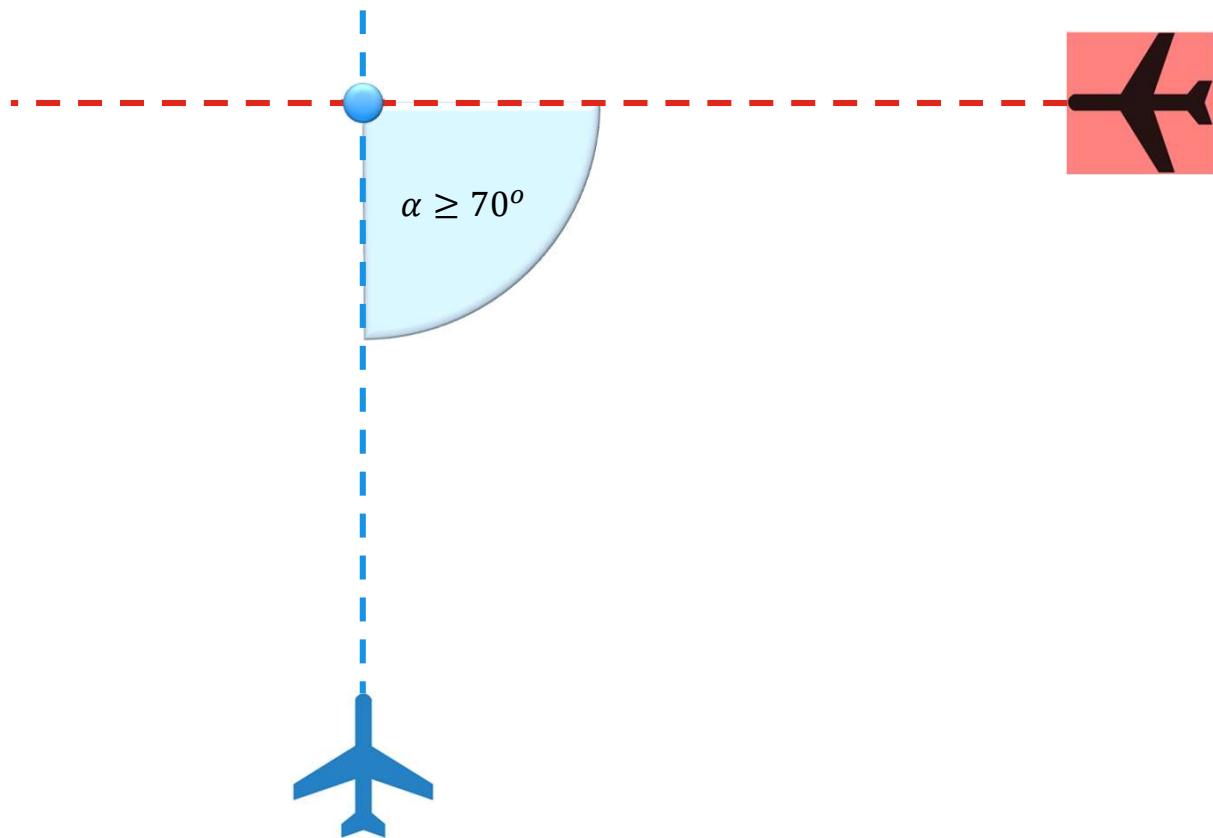

To be airworthy UAS needs to adhere some basic traffic rules, I will demonstrate the rules of the air which are valid for “controlled airspace”

Note:

Class C, A, airspaces, B are airports, they have more complex and intricate rules,

Your Notes:

Converging Maneuver - Trigger

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

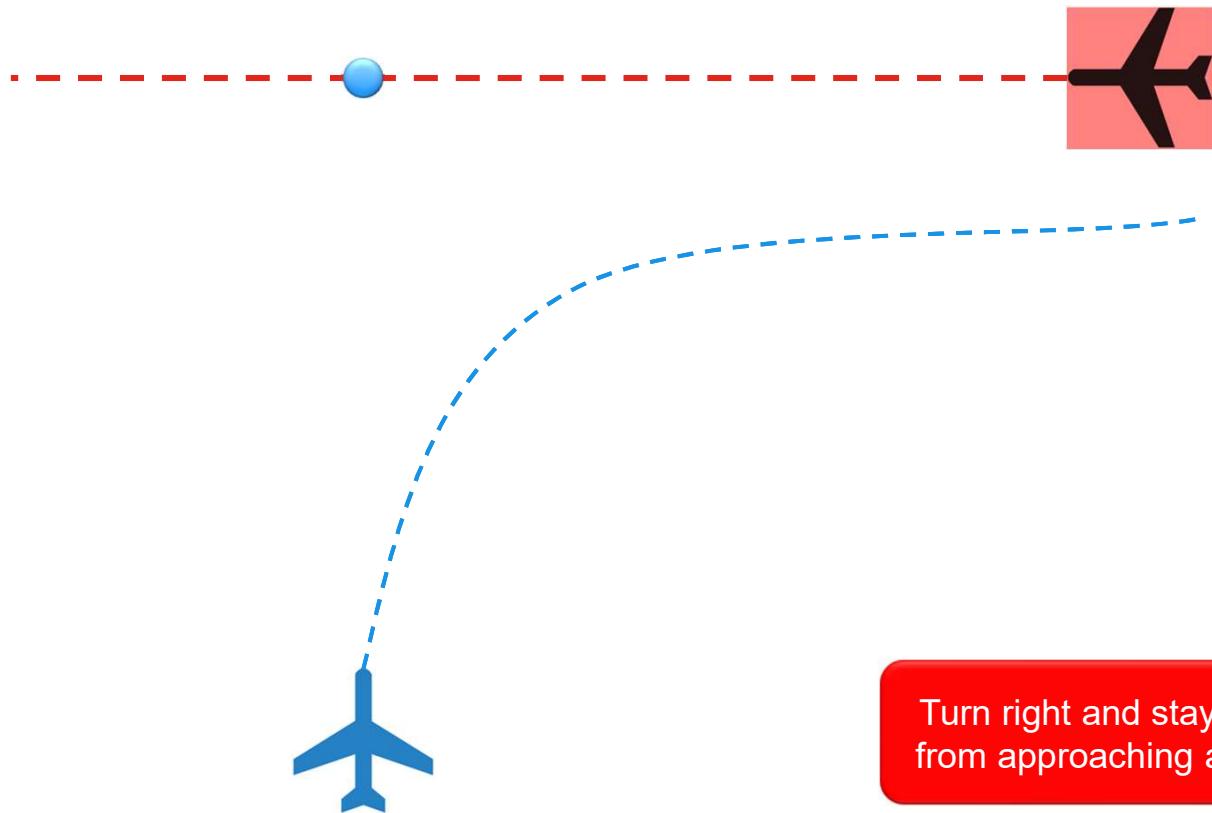

The converging maneuver needs to be executed when the angle of approach is above seventy degrees,

The right hand rule is applied,

The red plane has right of the way,

Your Notes:

Converging Maneuver - Resolution

Turn right and stay away
from approaching aircraft

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

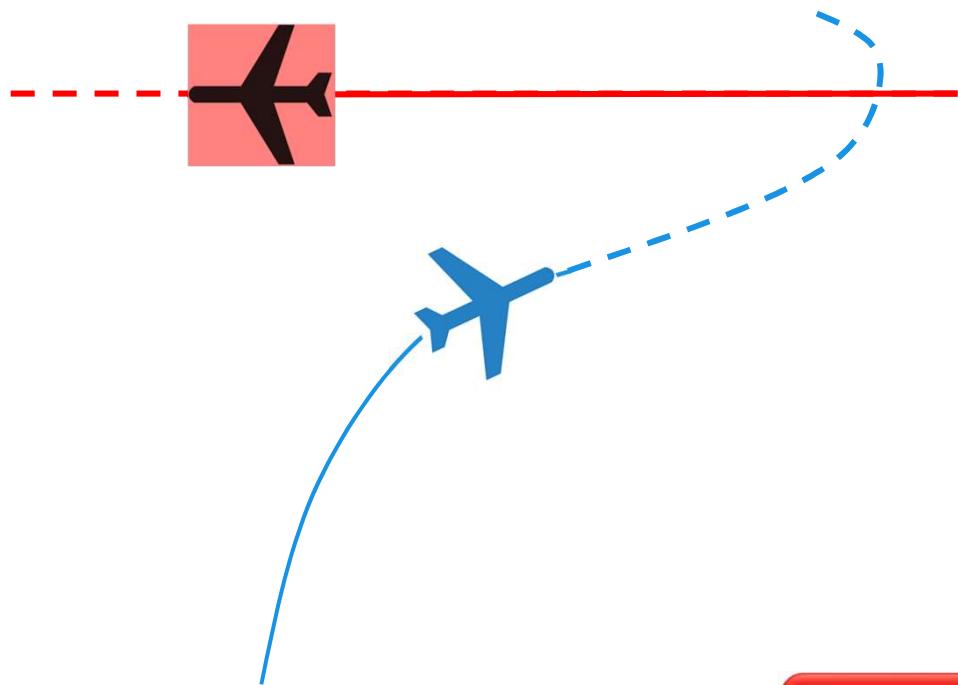

Speech:

The blue plane start avoidance keeping safe distance

Your Notes:

Converging Maneuver – Leave condition

Return to original path
behind other aircraft

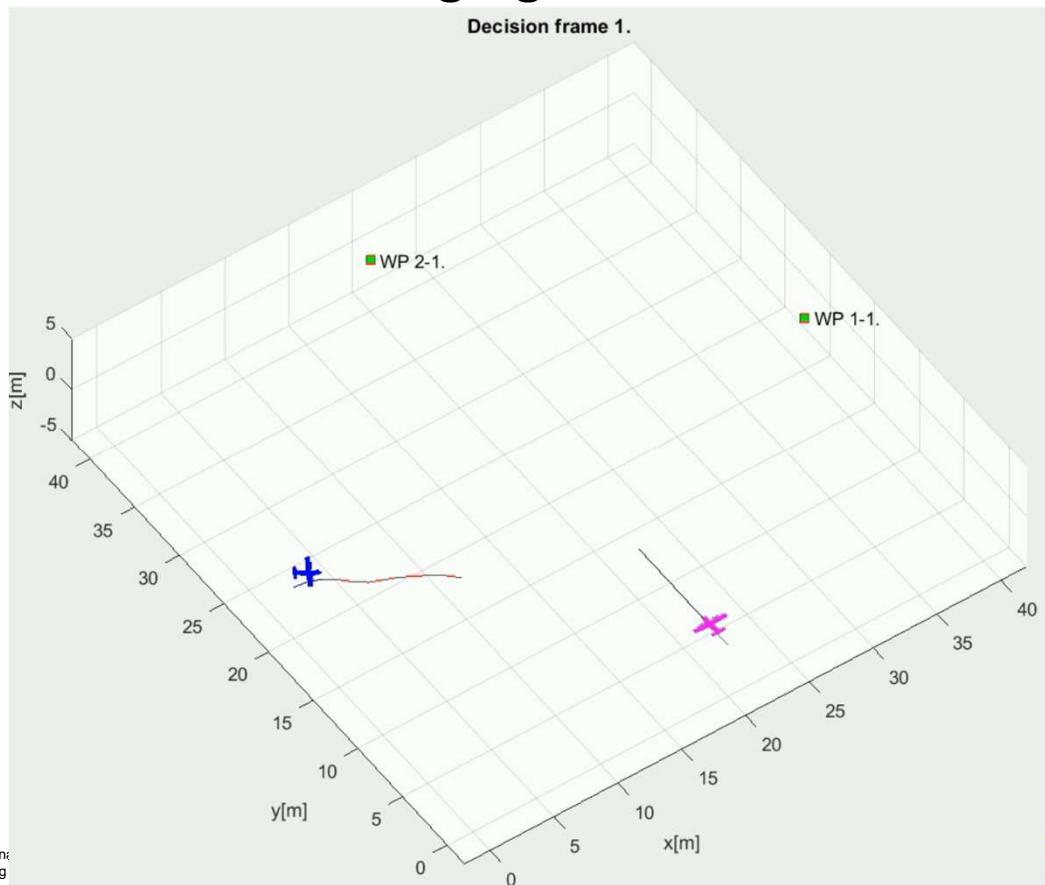

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The blue plane avoids wake turbulence and returns to original path

Scenario (7.4.1): Rule-based converging

© 2019 by Honeywell International:
MarineUAS - Innovative Training
This project has received funding

oneywell
POWER OF CONNECTED

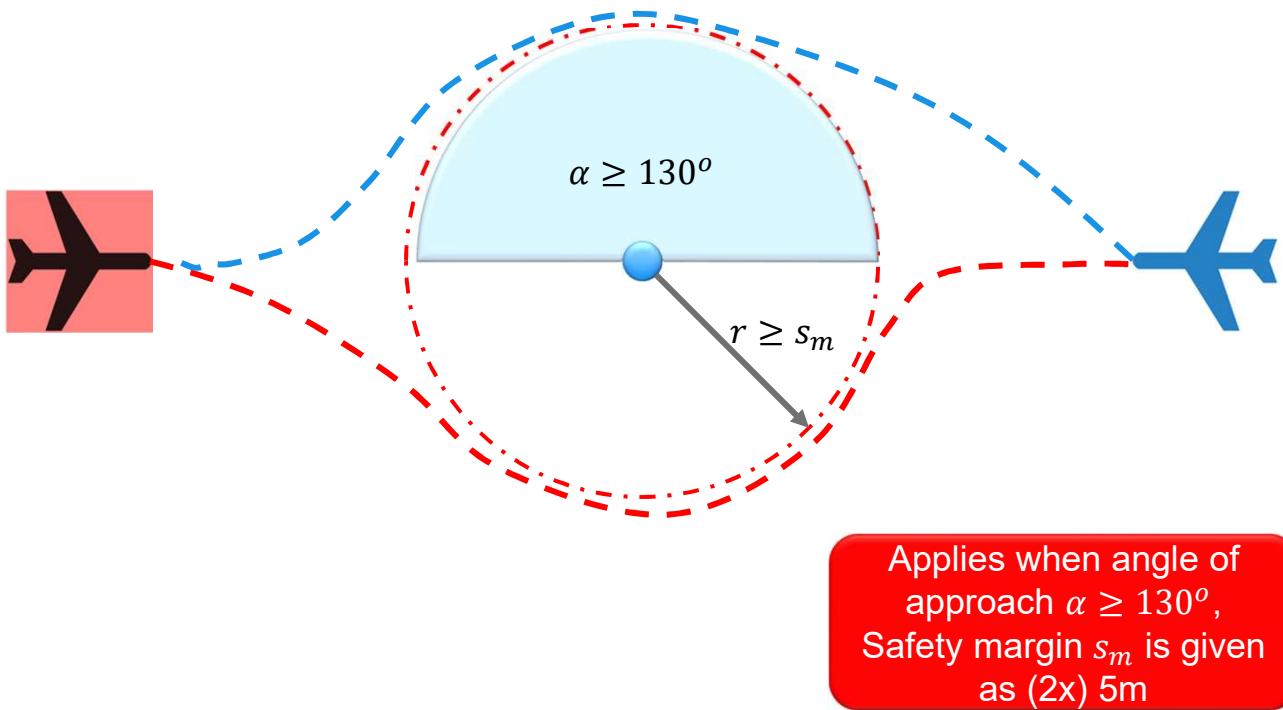

Speech:

Blue plane avoids magenta plane, which has
“right of the way”

The rule engine has been deployed to tweak process,

Your Notes:

Head On Approach - Trigger

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

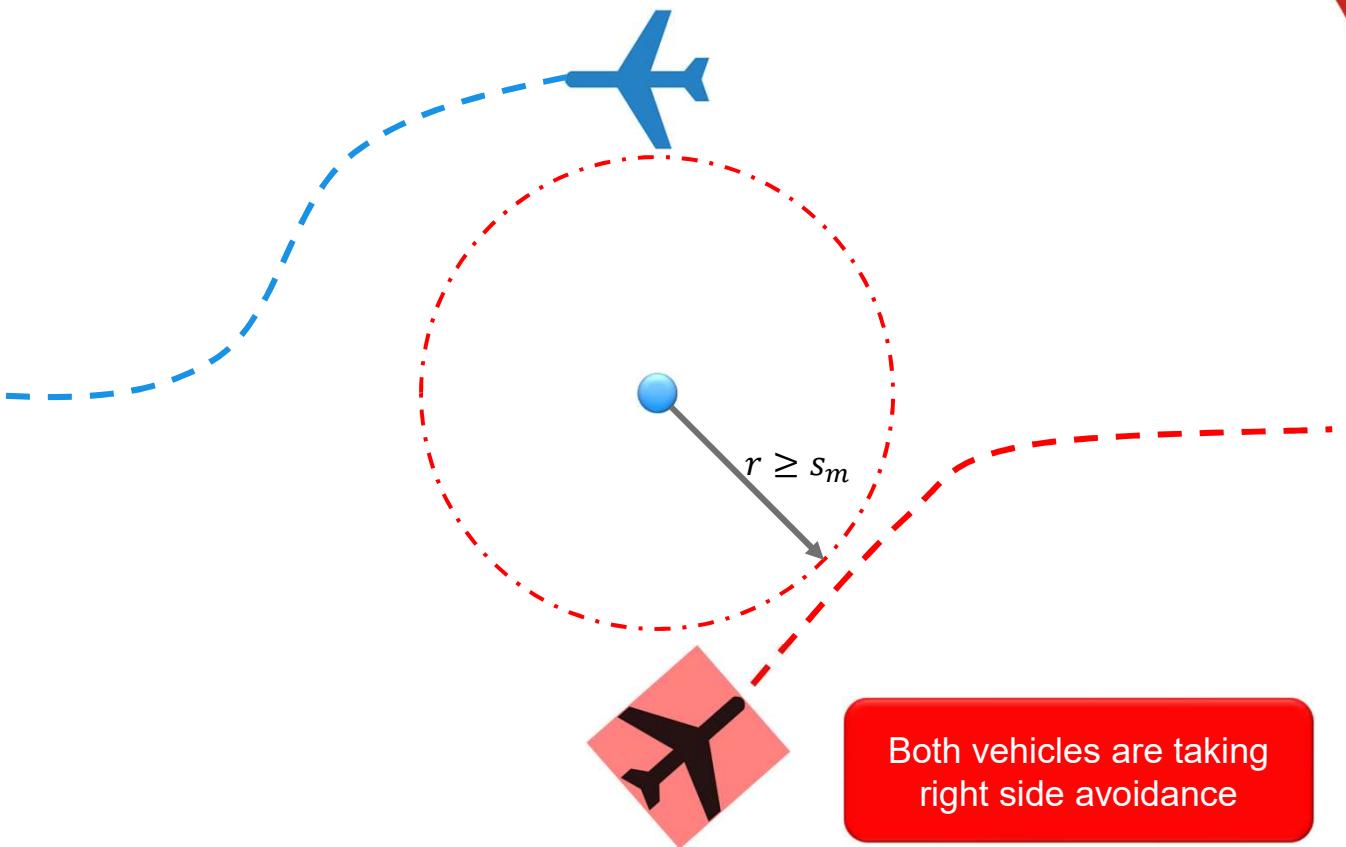

The “Head on approach” is triggered when the angle of approach is greater than 130 degrees

None of planes has the right of the way,

The virtual round about concept is used

Your Notes:

Head On Approach - Resolution

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Both planes keep safe distance from expected collision point to avoid wake and side turbulences

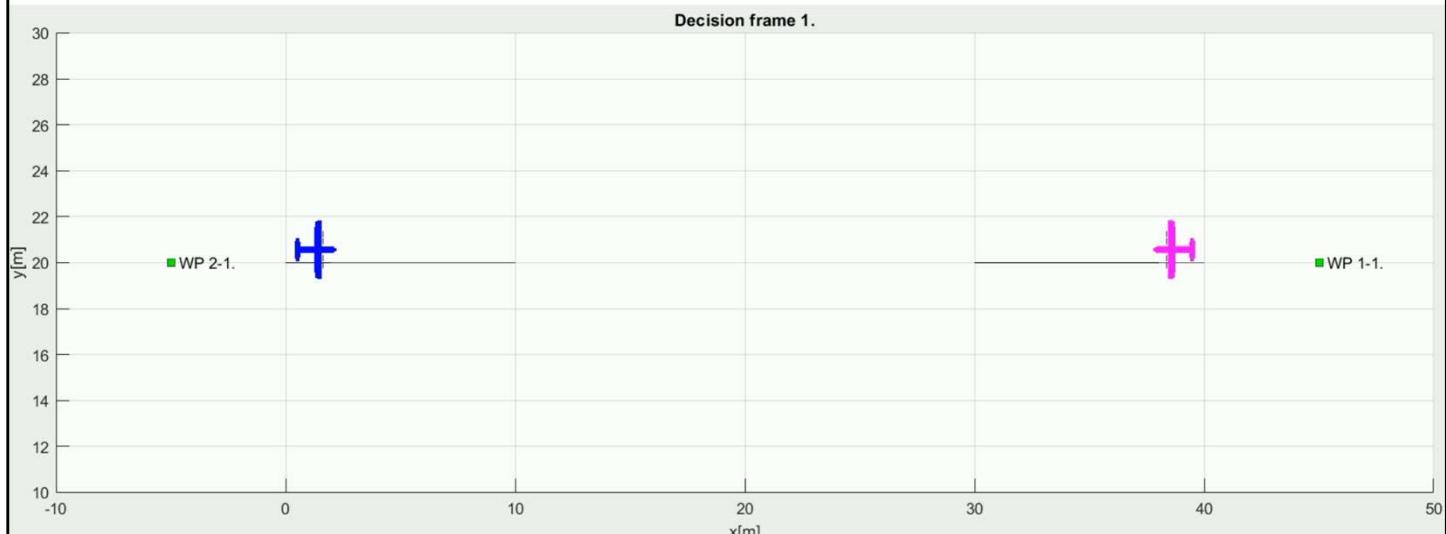

The maneuver ends when virtual roundabout is used

Note:

Every rule can fail, then its “Every man for himself” situation solved by “upper right corner” avoidance.

Your Notes:

Scenario (7.4.2): Rule-based head-on

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

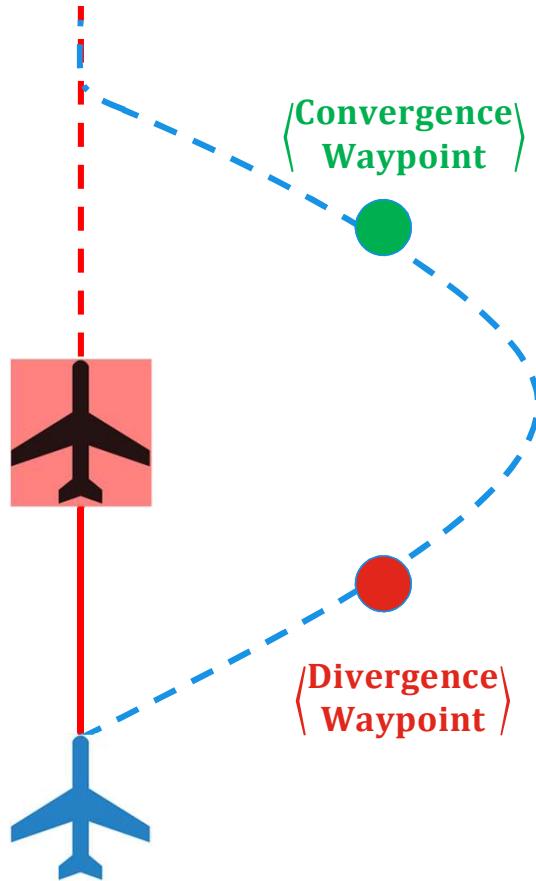

Speech:

The collision point is used as a center of virtual roundabout
Both planes start to converge to original waypoint when the collision point is passed,

Your Notes:

Overtake Maneuver - Trigger

The aircraft being overtaken has the right of the way

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

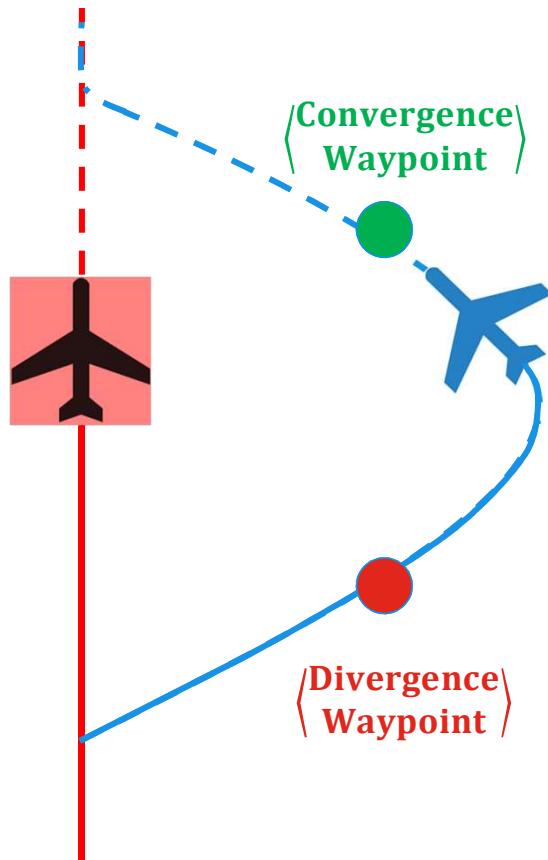

Faster blue airplane is overtaking slower red airplane

Faster blue airplane needs to take detour,

The standard solution is to follow divergence waypoint and start returning on convergence waypoint

Your Notes:

Overtake Maneuver - Resolution

Overtake is executed from right

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

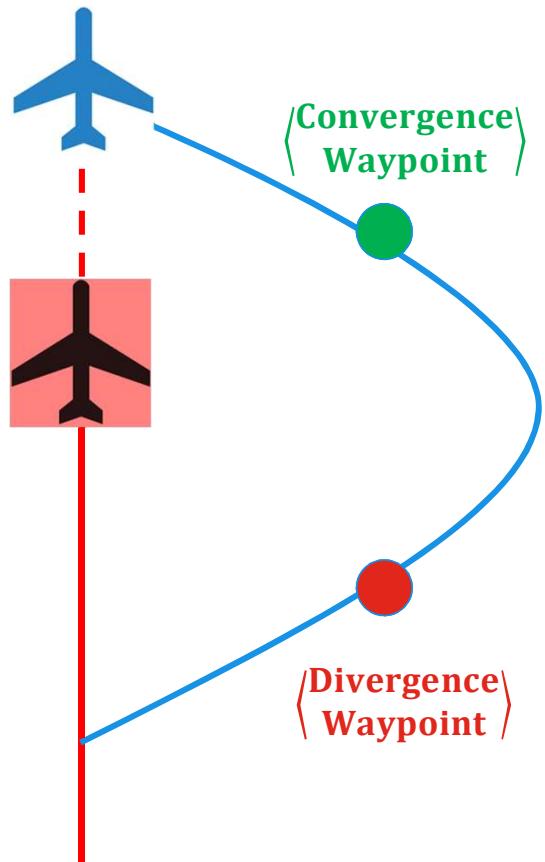

Speech:

It's going like this,

During overtake both planes should keep constant speed

Your Notes:

Overtake Maneuver – Leave Condition

Overtake rule may apply
only when well clear
condition is guaranteed

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

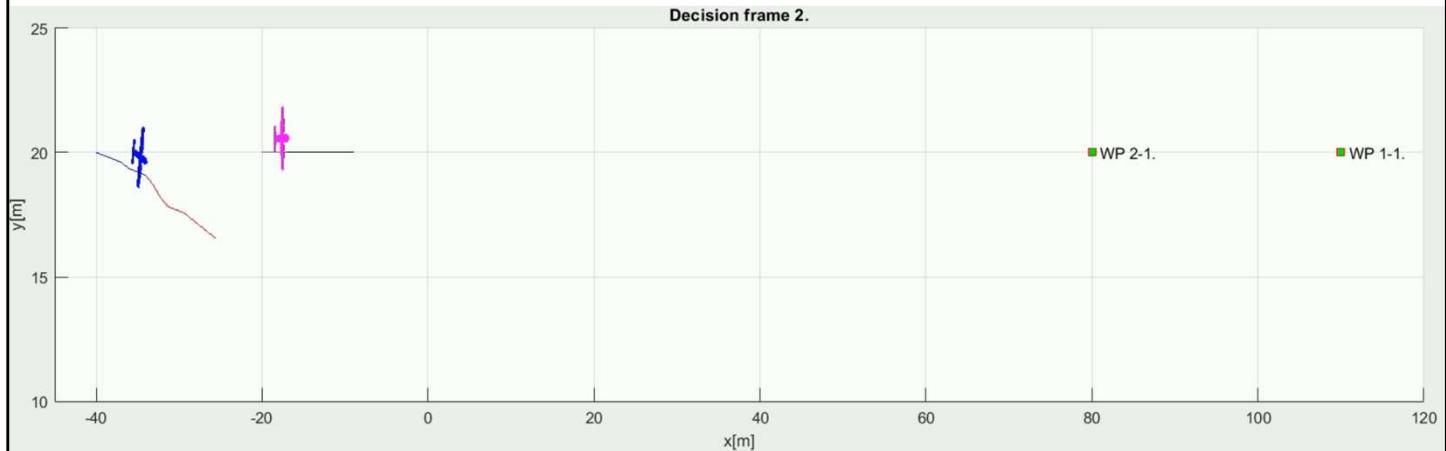

Speech:

Then it finishes like this

Your Notes:

Scenario (7.4.4): Rule-based overtaking

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

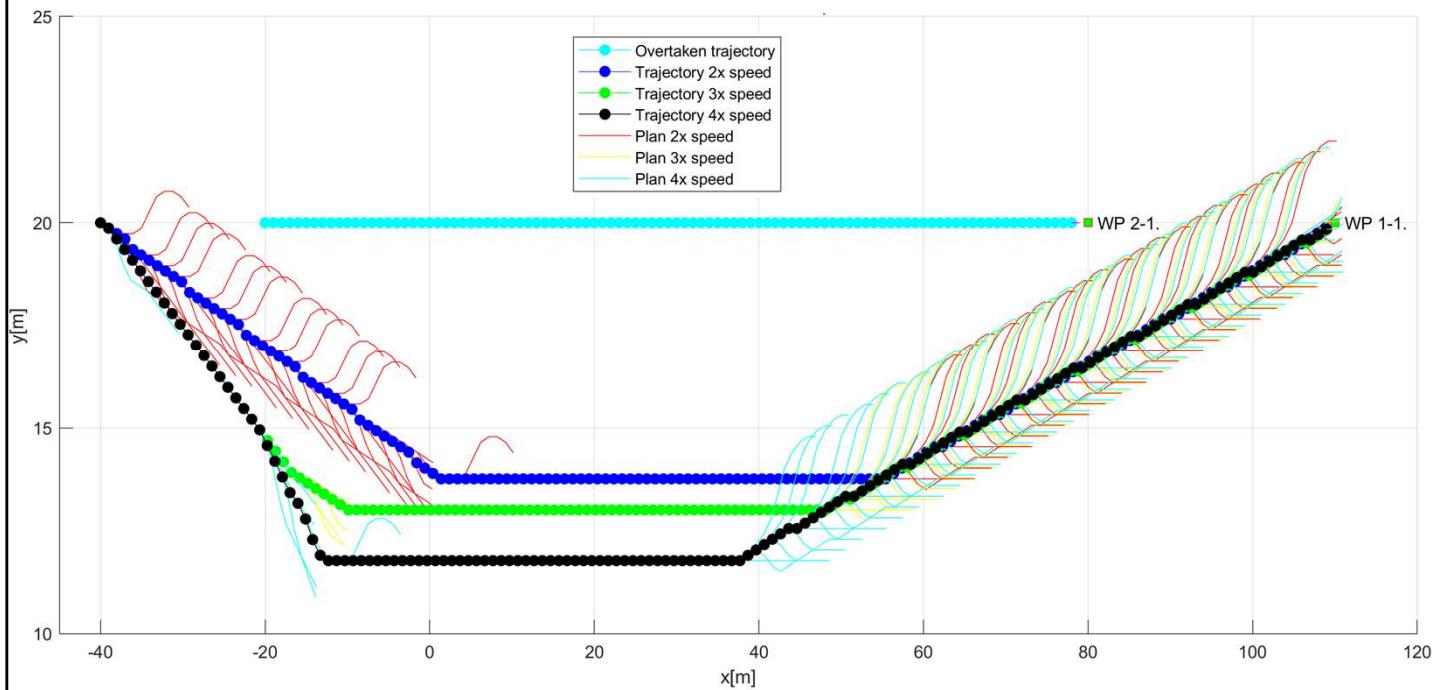

Here you can see overtaking maneuver implemented in our framework,

The blue plane is following the divergence waypoint

The blue plane returns on convergence waypoint when its wake turbulence does not harm magenta plane

Your Notes:

Different speed: Overtake Maneuver

© 2019 by Honeywell International Inc. All rights reserved.
 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The divergence and convergence waypoints are calculated according to vehicle classes and speed difference,

Here you can see how the overtaking trajectory wider with increase of speed difference

Note:

The speed difference changes the shape of overtaking trajectory,

The turn angle and shape is getting more sharp

Blue trajectory shows overtaking with 2x speed difference

Green trajectory shows overtaking with 3x speed difference

Black trajectory shows overtaking with 4x speed difference.

Simulations:

Cooperative vs. Noncooperative

Multi-Collision Situations

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

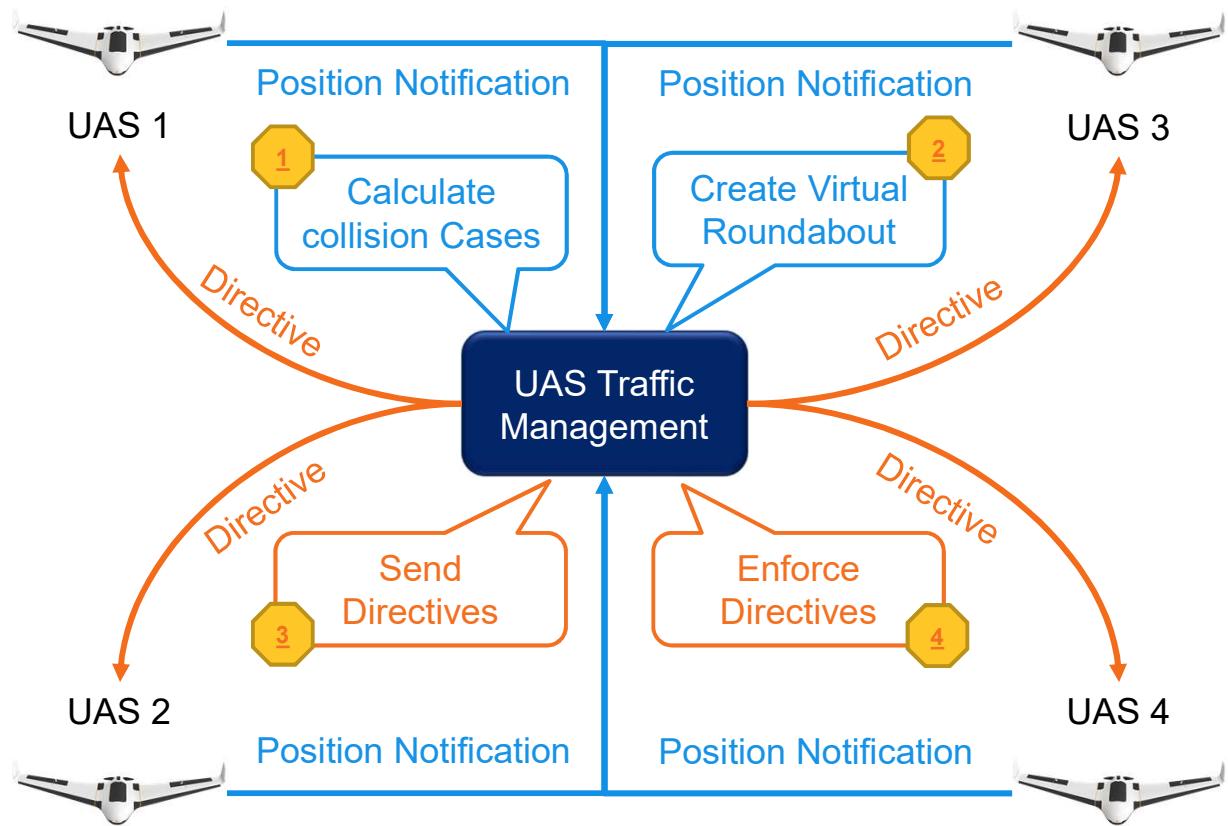

Speech:

The multi collision can be solved in cooperative or non-cooperative manner, let's take look on some more complex scenarios.

Your Notes:

Cooperative separation scenario

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

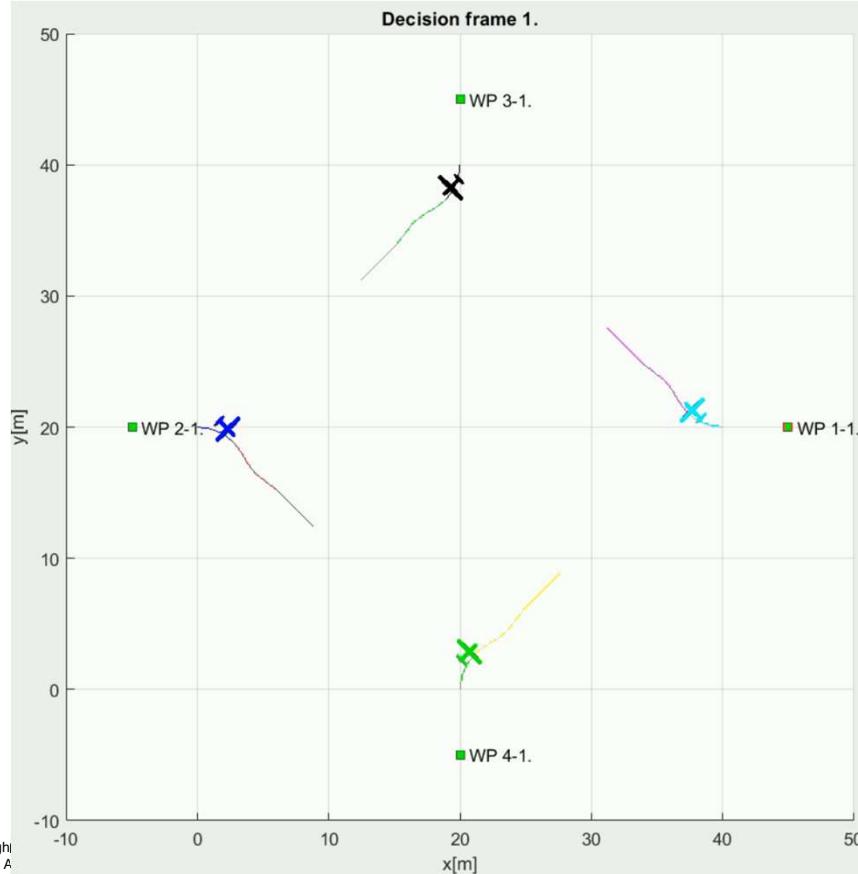

Speech:

There is a central UTM authority,
The UAS gives their “Position notification”,
The UAS is enforcing “Directives as a commands”,

Your Notes:

Scenario (7.4.3): Rule-based mixed head-on with converging

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous
This project has received funding from the European Union's Horizon 2020 research and innovation programme.

Honeywell
THE POWER OF CONNECTED

Speech:

In controlled airspace, where central authority is present, UAS are forced to cooperate,

The multi collision case scenario is solved with sufficiently big roundabout,

The capacity of virtual roundabout is depending on standard cruising speed,

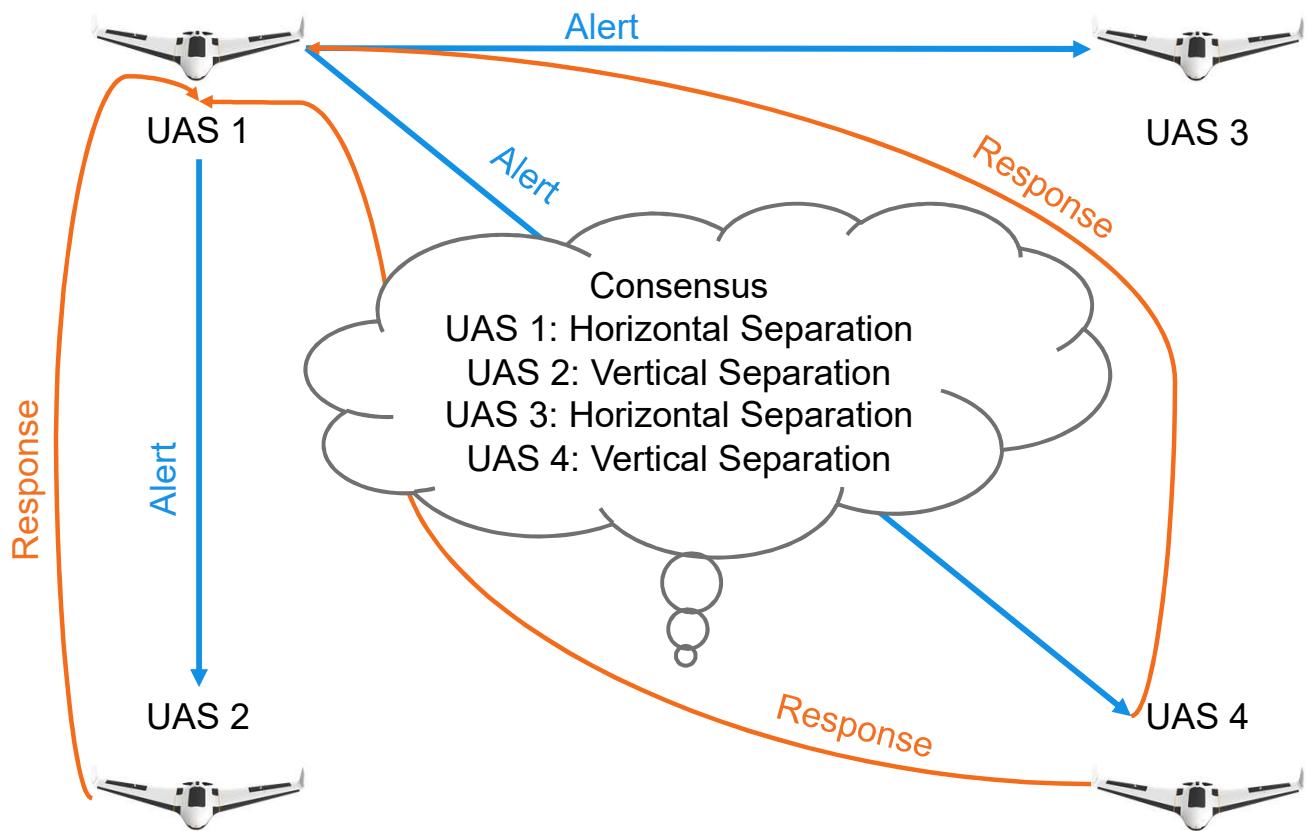

All planes need to use same speed while on roundabout

Note:

The algorithm to calculate roundabout and merge collision points is given by ICAO and its bounded to definition of airworthiness

Therefore any plane operating in controlled airspace is capable to adhere to ATM/UTM directives

Non-cooperative separation scenario

© 2019 by Honeywell International Inc. All rights reserved.
MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

Now lets get to non cooperative mode,

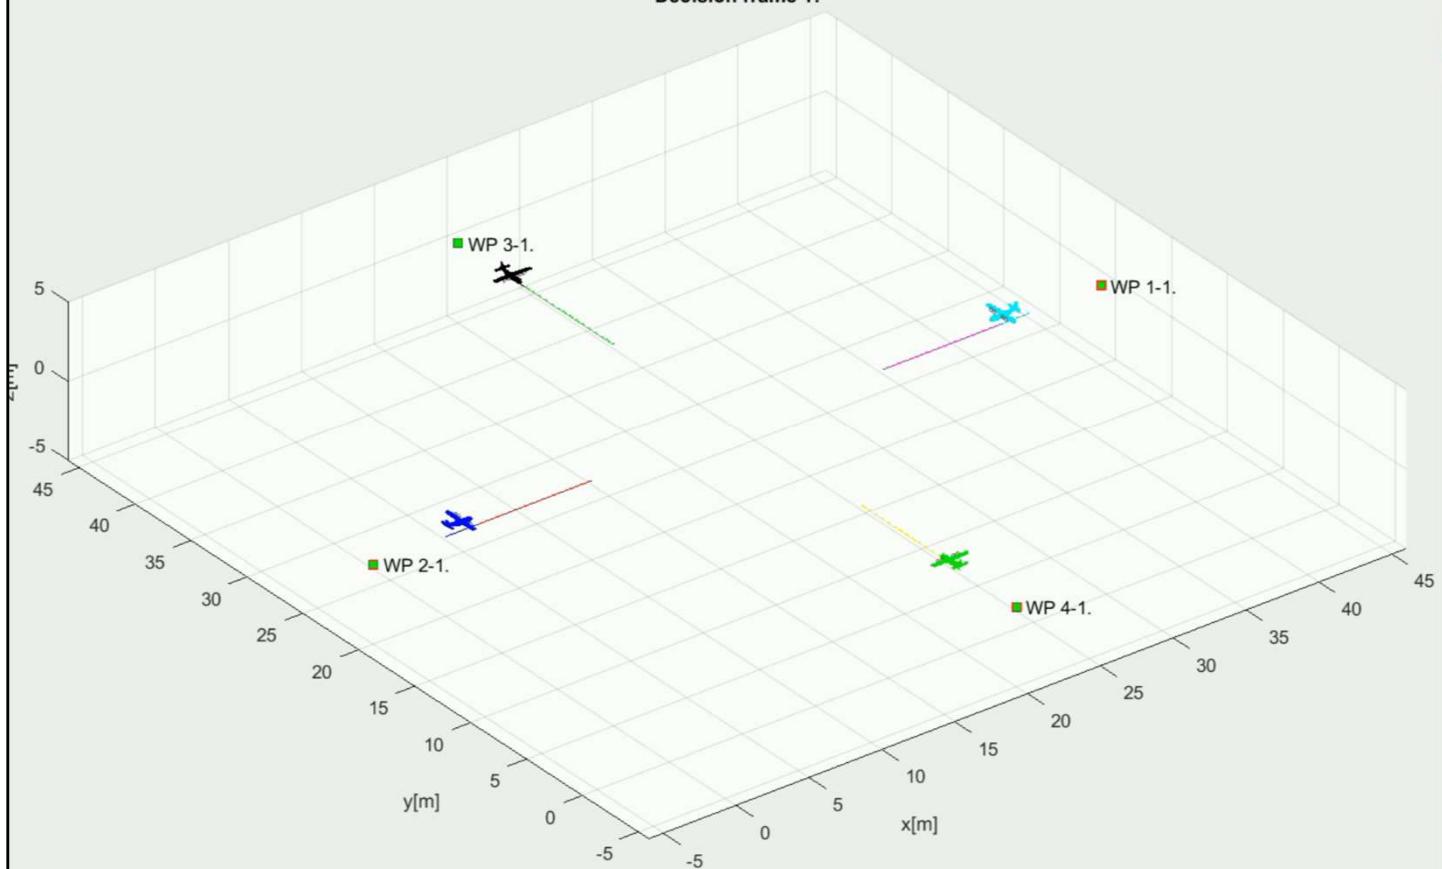

Each UAS is detecting own collisions, alerting others through ADS-B

Each UAS is using our approach to calculate own avoidance trajectory which gave them best possible odds of survival

Your Notes:

Scenario (7.3.7): Emergency mixed head-on with converging

Decision frame 1.

Speech:

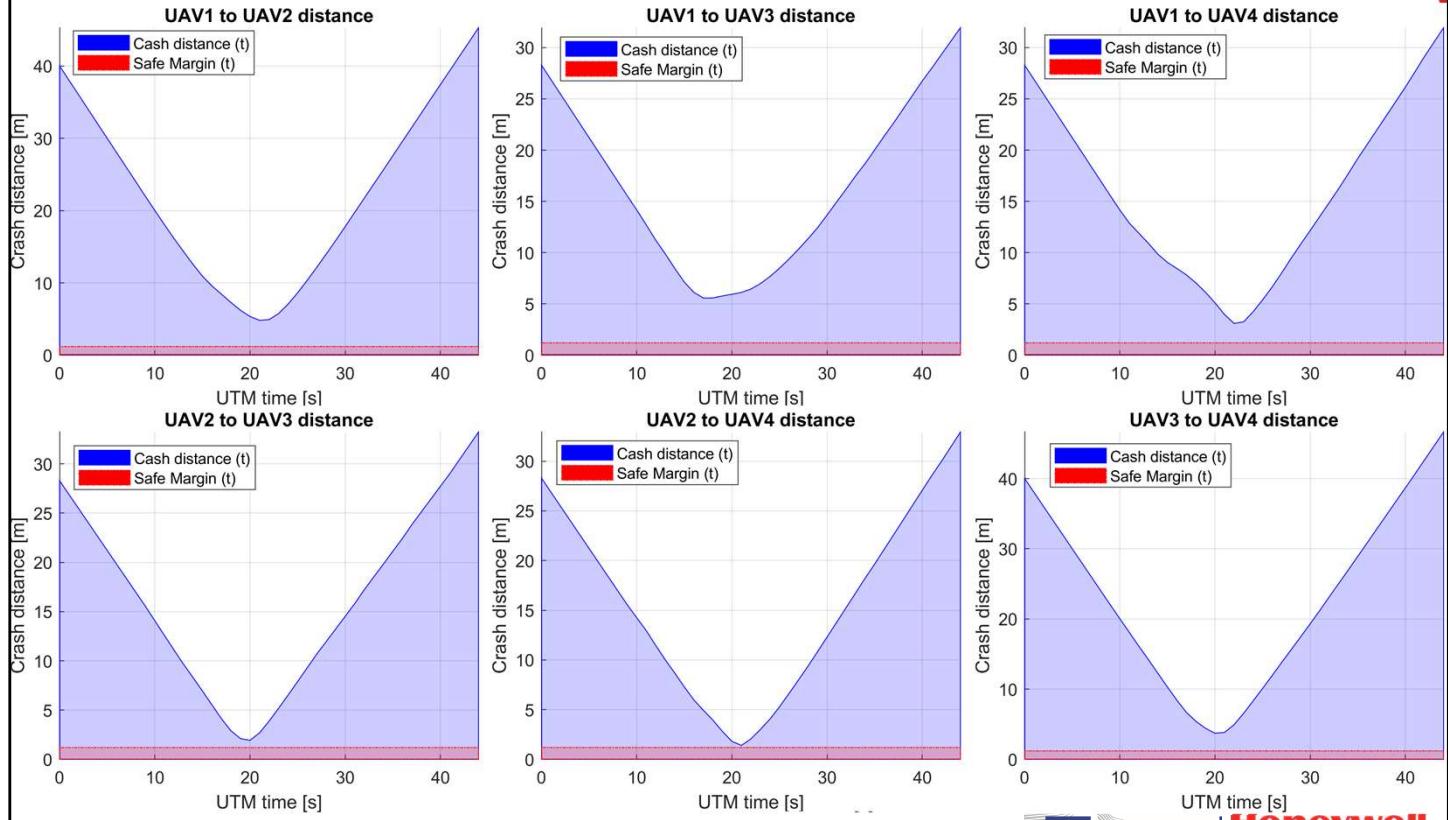

Each UAS is using own calculations to increase odds of survival

They start to react at the last moment around the collision point

As you can see it seems almost like collision,

Your Notes:

Performance: Non-cooperative separation scenario

© 2019 by Honeywell International Inc. All rights reserved.

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

There is a diagram showing mutual distance between UAS

The blue line represents the crash distance,

The red line represents safety margin

The safety margin was not breach in any case

Therefore, the operation is considered as safe,

Note:

The usual safety margins are way greater, the safety margin was 4x diameter of UAS (30 cm)=> 1.2m

Your Notes:

Simulations results – non-cooperative

Scenario name	Safety Margin		Breach	Trajectory tracking			Pass / Fail		
	Distance			Waypoint Reach	Reference Deviation	Acceptable Deviation			
	min	max							
Building avoidance (sim. 7.1)	0.69 m UAS 1	24.98 m UAS 1	No (7.2)	Yes/UAS 1/(7.3)	WP ₁ : 107.05m WP ₂ : 86.20m WP ₃ : 28.70m WP ₄ : 32.84m	Yes (7.10)	Pass		
Slalom (sim. 7.5)	0.09 m UAS 1	3.74 m UAS 1	No (7.6)	Yes/UAS 1/(7.7)	WP ₁ : 20.06m	Yes (7.14)	Pass		
Maze (sim 7.9)	0.01 m UAS 1	2.95 m UAS 1	No (7.10)	Yes/UAS 1/(7.11)	WP ₁ : 28.06m	Yes (7.18)	Pass		
Storm (sim. 7.13)	0.04 m UAS 1	34.99 m UAS 1	No (7.14)	Yes/UAS 1/(7.15)	WP ₁ : 15.76m	Yes (7.22)	Pass		
Emergency Converging (sim. 7.17)	1.67 m UAS 1-2	27.08 m UAS 1-1	No (7.18)	Yes/UAS 1/(7.19a) Yes/UAS 2/(7.19b)	WP ₁ : 3.25m WP ₁ : 0.00m	Yes (7.26)	Pass		
Emergency Head On (sim. 7.21)	0.38 m UAS 1-2	38.00 m UAS 1-2	No (7.22)	Yes/UAS 1/(7.23a) Yes/UAS 2/(7.23b)	WP ₁ : 3.25m WP ₁ : 0.00m	Yes (7.30)	Pass		
Emergency Multiple (sim. 7.25)	0.20 m UAS 2-4	45.46 m UAS 3-4	No (7.26)	Yes/UAS 1/(7.27a) Yes/UAS 2/(7.27b) Yes/UAS 3/(7.27c) Yes/UAS 4/(7.27d)	WP ₁ : 4.84m WP ₁ : 1.83m WP ₁ : 3.45m WP ₁ : 2.05m	Yes (7.34)	Pass

MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring

This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

THE POWER OF CONNECTED

Speech:

For all test cases we have tracked:

“Safety margin breach” which is primary performance criterion,

All simulations have passed

Note:

There are secondary criterions,

1. Path tracking performance: - deviations from expected trajectory
2. Computation load performance – maneuver feasibility by computational point of the view

Some of simulations has not been presented

Your Notes:

Simulations results – cooperative

Scenario name	Safety Margin		Breach	Trajectory tracking			Pass / Fail		
	Distance			Waypoint Reach	Reference Deviation	Acceptable Deviation			
	min	max							
Rule-based Converging (sim. 7.29)	1.22 m UAS 1-2	20.28 m UAS 1-2	No (7.37)	Yes/UAS 1/(7.31a) Yes/UAS 2/(7.31b)	WP ₁ : 10.22m WP ₁ : 0.00m	Yes (7.38)	Pass		
Rule-based Head On (sim. 7.33)	0.21 m UAS 1-2	36.33 m UAS 1-2	No (7.34)	Yes/UAS 1/(7.35a) Yes/UAS 2/(7.35b)	WP ₁ : 5.40m WP ₁ : 5.40m	Yes (7.42)	Pass		
Rule-based Multiple (sim. 7.37)	0.54 m UAS 2-3	32.24 m UAS 1-2	No (7.38)	Yes/UAS 1/(7.39a) Yes/UAS 2/(7.39b) Yes/UAS 3/(7.39c) Yes/UAS 4/(7.39d)	WP ₁ : 11.40m WP ₁ : 11.40m WP ₁ : 11.40m WP ₁ : 11.40m	Yes (7.46)	Pass		
Rule-based Overtake (sim. 7.41)	0.80 m UAS 1-2	48.85 m UAS 1-2	No (7.43)	Yes/UAS 1/(7.44a) Yes/UAS 2/(7.44b)	WP ₁ : 24.00m WP ₂ : 0.00m WP ₃ : 4.00m WP ₄ : 5.00m WP ₁ : 0.00m	Yes (7.51)	Pass

 MarineUAS - Innovative Training Network on Autonomous Unmanned Aerial Systems for Marine and Coastal Monitoring
 This project has received funding from European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642153

Speech:

The same goes for the cooperative test cases,

All simulations have passed,

Note:

You have seen all simulations from this test set during presentation

These test cases can be used for your approach evaluation

Your Notes:

Conclusion

Contributions:

- Reach Set Approximation methods
- Scalable navigation algorithm
- Portable D&A solution

- UTM services for phase II. & III.
- Set of test scenarios

Reach Set Approximation:

- Reach set approximated as a set of discrete trajectories
- Relationship between trajectories and operational space - coverage
- Minimal reach set representation
- Behavior encoded in Reach set

Approach avoidance capabilities:

- Static obstacles
- (Non-)cooperative intruders
- Geo-fenced areas
- Weather threats

- UTM Resolutions (Rule engine)

Approach reusability/portability:

- Abstract data fusion procedure
- Control interface as discrete command chain (movements)

- Events & decision making
- UTM services definition
